

# IsarMathLib

Ślawomir Kołodziej, Daniel de la Concepción Sáez

June 20, 2015

## Abstract

This is the proof document of the IsarMathLib project version 1.9.1. IsarMathLib is a library of formalized mathematics for Isabelle 2013-2 (ZF logic).

## Contents

<b>1</b>	<b>Introduction.thy</b>	<b>10</b>
1.1	How to read IsarMathLib proofs - a tutorial . . . . .	10
1.2	Overview of the project . . . . .	12
<b>2</b>	<b>Fol1.thy</b>	<b>16</b>
2.1	Notions and lemmas in FOL . . . . .	16
<b>3</b>	<b>ZF1.thy</b>	<b>19</b>
3.1	Lemmas in Zermelo-Fraenkel set theory . . . . .	19
<b>4</b>	<b>Nat_ZF.thy</b>	<b>25</b>
4.1	Induction . . . . .	25
4.2	Intervals . . . . .	30
<b>5</b>	<b>Order_ZF.thy</b>	<b>32</b>
5.1	Definitions . . . . .	32
5.2	Intervals . . . . .	35
5.3	Bounded sets . . . . .	36
<b>6</b>	<b>Order_ZF_1.thy</b>	<b>43</b>
6.1	Definitions and basic properties . . . . .	43
6.2	Properties of (strict) total orders . . . . .	45
<b>7</b>	<b>Order_ZF_1a.thy</b>	<b>49</b>
7.1	Maximum and minimum of a set . . . . .	49
7.2	Supremum and Infimum . . . . .	56
7.3	Strict versions of order relations . . . . .	59

<b>8</b>	<b>NatOrder_ZF.thy</b>	<b>63</b>
8.1	Order on natural numbers . . . . .	63
<b>9</b>	<b>func1.thy</b>	<b>65</b>
9.1	Properties of functions, function spaces and (inverse) images.	65
9.2	Functions restricted to a set . . . . .	79
9.3	Constant functions . . . . .	81
9.4	Injections, surjections, bijections etc. . . . .	82
9.5	Functions of two variables . . . . .	90
<b>10</b>	<b>func_ZF.thy</b>	<b>95</b>
10.1	Lifting operations to a function space . . . . .	95
10.2	Associative and commutative operations . . . . .	97
10.3	Restricting operations . . . . .	99
10.4	Compositions . . . . .	102
10.5	Identity function . . . . .	103
10.6	Lifting to subsets . . . . .	105
10.7	Distributive operations . . . . .	110
<b>11</b>	<b>func_ZF_1.thy</b>	<b>112</b>
11.1	Functions and order . . . . .	112
11.2	Projections in cartesian products . . . . .	116
11.3	Induced relations and order isomorphisms . . . . .	117
<b>12</b>	<b>Generalization_ZF.thy</b>	<b>125</b>
12.1	Generalization situation . . . . .	125
12.2	Arbitrary generalizations . . . . .	126
12.3	ZF generalization . . . . .	127
<b>13</b>	<b>NatGenIntEx_ZF.thy</b>	<b>131</b>
<b>14</b>	<b>Finite_ZF.thy</b>	<b>132</b>
14.1	Definition and basic properties of finite powerset . . . . .	132
<b>15</b>	<b>Finite1.thy</b>	<b>142</b>
15.1	Finite powerset . . . . .	142
15.2	Finite range functions . . . . .	149
<b>16</b>	<b>Finite_ZF_1.thy</b>	<b>151</b>
16.1	Finite vs. bounded sets . . . . .	151
<b>17</b>	<b>FinOrd_ZF.thy</b>	<b>155</b>
17.1	Finite vs. bounded sets . . . . .	155
17.2	Order isomorphisms of finite sets . . . . .	156

<b>18</b>	<b>EquivClass1.thy</b>	<b>163</b>
18.1	Congruent functions and projections on the quotient . . . . .	163
18.2	Projecting commutative, associative and distributive operations. . . . .	169
18.3	Saturated sets . . . . .	171
<b>19</b>	<b>FiniteSeq_ZF.thy</b>	<b>175</b>
19.1	Lists as finite sequences . . . . .	175
19.2	Lists and cartesian products . . . . .	189
<b>20</b>	<b>InductiveSeq_ZF.thy</b>	<b>192</b>
20.1	Sequences defined by induction . . . . .	192
20.2	Images of inductive sequences . . . . .	199
20.3	Subsets generated by a binary operation . . . . .	200
20.4	Inductive sequences with changing generating function . . . . .	202
<b>21</b>	<b>Fold_ZF.thy</b>	<b>207</b>
21.1	Folding in ZF . . . . .	207
<b>22</b>	<b>Partitions_ZF.thy</b>	<b>212</b>
22.1	Bisections . . . . .	212
22.2	Partitions . . . . .	214
<b>23</b>	<b>Enumeration_ZF.thy</b>	<b>217</b>
23.1	Enumerations: definition and notation . . . . .	217
23.2	Properties of enumerations . . . . .	218
<b>24</b>	<b>Semigroup_ZF.thy</b>	<b>221</b>
24.1	Products of sequences of semigroup elements . . . . .	221
24.2	Products over sets of indices . . . . .	225
24.3	Commutative semigroups . . . . .	228
<b>25</b>	<b>CommutativeSemigroup_ZF.thy</b>	<b>241</b>
25.1	Sum of a function over a set . . . . .	241
<b>26</b>	<b>Monoid_ZF.thy</b>	<b>245</b>
26.1	Definition and basic properties . . . . .	245
<b>27</b>	<b>Group_ZF.thy</b>	<b>250</b>
27.1	Definition and basic properties of groups . . . . .	250
27.2	Subgroups . . . . .	260
<b>28</b>	<b>Group_ZF_1.thy</b>	<b>267</b>
28.1	Translations . . . . .	267
28.2	Odd functions . . . . .	273

<b>29</b>	<b>Group_ZF_1b.thy</b>	<b>275</b>
29.1	An alternative definition of group . . . . .	275
<b>30</b>	<b>AbelianGroup_ZF.thy</b>	<b>278</b>
30.1	Rearrangement formulae . . . . .	278
<b>31</b>	<b>Group_ZF_2.thy</b>	<b>291</b>
31.1	Lifting groups to function spaces . . . . .	291
31.2	Equivalence relations on groups . . . . .	296
31.3	Normal subgroups and quotient groups . . . . .	299
31.4	Function spaces as monoids . . . . .	304
<b>32</b>	<b>Group_ZF_3.thy</b>	<b>305</b>
32.1	Group valued finite range functions . . . . .	305
32.2	Almost homomorphisms . . . . .	307
32.3	The classes of almost homomorphisms . . . . .	315
32.4	Compositions of almost homomorphisms . . . . .	318
32.5	Shifting almost homomorphisms . . . . .	327
<b>33</b>	<b>DirectProduct_ZF.thy</b>	<b>329</b>
33.1	Definition . . . . .	329
33.2	Associative and commutative operations . . . . .	330
<b>34</b>	<b>OrderedGroup_ZF.thy</b>	<b>331</b>
34.1	Ordered groups . . . . .	331
34.2	Inequalities . . . . .	337
34.3	The set of positive elements . . . . .	349
34.4	Intervals and bounded sets . . . . .	356
<b>35</b>	<b>OrderedGroup_ZF_1.thy</b>	<b>363</b>
35.1	Absolute value and the triangle inequality . . . . .	363
35.2	Maximum absolute value of a set . . . . .	375
35.3	Alternative definitions . . . . .	377
35.4	Odd Extensions . . . . .	380
35.5	Functions with infinite limits . . . . .	382
<b>36</b>	<b>Ring_ZF.thy</b>	<b>387</b>
36.1	Definition and basic properties . . . . .	387
36.2	Rearrangement lemmas . . . . .	394
<b>37</b>	<b>Ring_ZF_1.thy</b>	<b>398</b>
37.1	The ring of classes of almost homomorphisms . . . . .	398

<b>38 OrderedRing_ZF.thy</b>	<b>401</b>
38.1 Definition and notation . . . . .	401
38.2 Absolute value for ordered rings . . . . .	409
38.3 Positivity in ordered rings . . . . .	411
<b>39 Cardinal_ZF.thy</b>	<b>419</b>
39.1 Some new ideas on cardinals . . . . .	419
39.2 Main result on cardinals (without the <i>Axiom of Choice</i> ) . . .	423
39.3 Choice axioms . . . . .	426
<b>40 Group_ZF_4.thy</b>	<b>431</b>
40.1 Conjugation of subgroups . . . . .	431
40.2 Finite groups . . . . .	436
40.3 Subgroups generated by sets . . . . .	439
40.4 Homomorphisms . . . . .	440
40.4.1 First isomorphism theorem . . . . .	446
<b>41 Field_ZF.thy</b>	<b>455</b>
41.1 Definition and basic properties . . . . .	455
41.2 Equations and identities . . . . .	458
41.3 $1/0=0$ . . . . .	459
<b>42 OrderedField_ZF.thy</b>	<b>461</b>
42.1 Definition and basic properties . . . . .	461
42.2 Inequalities . . . . .	464
42.3 Definition of real numbers . . . . .	468
<b>43 Int_ZF.thy</b>	<b>469</b>
43.1 Addition and multiplication as ZF-functions. . . . .	469
43.2 Integers as an ordered group . . . . .	476

# 1 Introduction.thy

**theory** Introduction imports equalities

**begin**

This theory does not contain any formalized mathematics used in other theories, but is an introduction to IsarMathLib project.

## 1.1 How to read IsarMathLib proofs - a tutorial

Isar (the Isabelle's formal proof language) was designed to be similar to the standard language of mathematics. Any person able to read proofs in a typical mathematical paper should be able to read and understand Isar proofs without having to learn a special proof language. However, Isar is a formal proof language and as such it does contain a couple of constructs whose meaning is hard to guess. In this tutorial we will define a notion and prove an example theorem about that notion, explaining Isar syntax along the way. This tutorial may also serve as a style guide for IsarMathLib contributors. Note that this tutorial aims to help in reading the presentation of the Isar language that is used in IsarMathLib proof document and HTML rendering on the FormalMath.org site, but does not teach how to write proofs that can be verified by Isabelle. This presentation is different than the source processed by Isabelle (the concept that the source and presentation look different should be familiar to any LaTeX user). To learn how to write Isar proofs one needs to study the source of this tutorial as well.

The first thing that mathematicians typically do is to define notions. In Isar this is done with the **definition** keyword. In our case we define a notion of two sets being disjoint. We will use the infix notation, i.e. the string `{is disjoint with}` put between two sets to denote our notion of disjointness. The left side of the  $\equiv$  symbol is the notion being defined, the right side says how we define it. In Isabelle `0` is used to denote both zero (of natural numbers) and the empty set, which is not surprising as those two things are the same in set theory.

**definition**

```
AreDisjoint (infix {is disjoint with} 90) where  
A {is disjoint with} B  $\equiv$   $A \cap B = 0$ 
```

We are ready to prove a theorem. Here we show that the relation of being disjoint is symmetric. We start with one of the keywords "theorem", "lemma" or "corollary". In Isar they are synonymous. Then we provide a name for the theorem. In standard mathematics theorems are numbered. In Isar we can do that too, but it is considered better to give theorems meaningful names. After the "shows" keyword we give the statement to show.

The  $\longleftrightarrow$  symbol denotes the equivalence in Isabelle/ZF. Here we want to show that "A is disjoint with B iff and only if B is disjoint with A". To prove this fact we show two implications - the first one that A {is disjoint with} B implies B {is disjoint with} A and then the converse one. Each of these implications is formulated as a statement to be proved and then proved in a subproof like a mini-theorem. Each subproof uses a proof block to show the implication. Proof blocks are delimited with curly brackets in Isar. Proof block is one of the constructs that does not exist in informal mathematics, so it may be confusing. When reading a proof containing a proof block I suggest to focus first on what is that we are proving in it. This can be done by looking at the first line or two of the block and then at the last statement. In our case the block starts with "assume A {is disjoint with} B" and the last statement is "then have B {is disjoint with} A". It is a typical pattern when someone needs to prove an implication: one assumes the antecedent and then shows that the consequent follows from this assumption. Implications are denoted with the  $\longrightarrow$  symbol in Isabelle. After we prove both implications we collect them using the "moreover" construct. The keyword "ultimately" indicates that what follows is the conclusion of the statements collected with "moreover". The "show" keyword is like "have", except that it indicates that we have arrived at the claim of the theorem (or a subproof).

```

theorem disjointness_symmetric:
  shows A {is disjoint with} B  $\longleftrightarrow$  B {is disjoint with} A
proof -
  have A {is disjoint with} B  $\longrightarrow$  B {is disjoint with} A
  proof -
    { assume A {is disjoint with} B
      then have A  $\cap$  B = 0 using AreDisjoint_def by simp
      hence B  $\cap$  A = 0 by auto
      then have B {is disjoint with} A
        using AreDisjoint_def by simp
    } thus thesis by simp
  qed
  moreover have B {is disjoint with} A  $\longrightarrow$  A {is disjoint with} B
  proof -
    { assume B {is disjoint with} A
      then have B  $\cap$  A = 0 using AreDisjoint_def by simp
      hence A  $\cap$  B = 0 by auto
      then have A {is disjoint with} B
        using AreDisjoint_def by simp
    } thus thesis by simp
  qed
  ultimately show thesis by blast
qed

```

## 1.2 Overview of the project

The `Fo11`, `ZF1` and `Nat_ZF_IML` theory files contain some background material that is needed for the remaining theories.

`Order_ZF` and `Order_ZF_1a` reformulate material from standard Isabelle's `Order` theory in terms of non-strict (less-or-equal) order relations. `Order_ZF_1` on the other hand directly continues the `Order` theory file using strict order relations (less and not equal). This is useful for translating theorems from Metamath.

In `NatOrder_ZF` we prove that the usual order on natural numbers is linear. The `func1` theory provides basic facts about functions. `func_ZF` continues this development with more advanced topics that relate to algebraic properties of binary operations, like lifting a binary operation to a function space, associative, commutative and distributive operations and properties of functions related to order relations. `func_ZF_1` is about properties of functions related to order relations.

The standard Isabelle's `Finite` theory defines the finite powerset of a set as a certain "datatype" (?) with some recursive properties. IsarMathLib's `Finite1` and `Finite_ZF_1` theories develop more facts about this notion. These two theories are obsolete now. They will be gradually replaced by an approach based on set theory rather than tools specific to Isabelle. This approach is presented in `Finite_ZF` theory file.

In `FinOrd_ZF` we talk about ordered finite sets.

The `EquivClass1` theory file is a reformulation of the material in the standard Isabelle's `EquivClass` theory in the spirit of ZF set theory.

`FiniteSeq_ZF` discusses the notion of finite sequences (a.k.a. lists).

`InductiveSeq_ZF` provides the definition and properties of (what is known in basic calculus as) sequences defined by induction, i. e. by a formula of the form  $a_0 = x$ ,  $a_{n+1} = f(a_n)$ .

`Fold_ZF` shows how the familiar from functional programming notion of fold can be interpreted in set theory.

`Partitions_ZF` is about splitting a set into non-overlapping subsets. This is a common trick in proofs.

`Semigroup_ZF` treats the expressions of the form  $a_0 \cdot a_1 \dots a_n$ , (i.e. products of finite sequences), where  $\cdot$  is an associative binary operation.

`CommutativeSemigroup_ZF` is another take on a similar subject. This time we consider the case when the operation is commutative and the result of depends only on the set of elements we are summing (additively speaking), but not the order.

The `Topology_ZF` series covers basics of general topology: interior, closure, boundary, compact sets, separation axioms and continuous functions.

`Group_ZF`, `Group_ZF_1`, `Group_ZF_1b` and `Group_ZF_2` provide basic facts of the group theory. `Group_ZF_3` considers the notion of almost homomorphisms that is needed for the real numbers construction in `Real_ZF`.

The `TopologicalGroup` connects the `Topology_ZF` and `Group_ZF` series and starts the subject of topological groups with some basic definitions and facts. In `DirectProduct_ZF` we define direct product of groups and show some its basic properties.

The `OrderedGroup_ZF` theory treats ordered groups. This is a surprisingly large theory for such relatively obscure topic.

`Ring_ZF` defines rings. `Ring_ZF_1` covers the properties of rings that are specific to the real numbers construction in `Real_ZF`.

The `OrderedRing_ZF` theory looks at the consequences of adding a linear order to the ring algebraic structure.

`Field_ZF` and `OrderedField_ZF` contain basic facts about (you guessed it) fields and ordered fields.

`Int_ZF_IML` theory considers the integers as a monoid (multiplication) and an abelian ordered group (addition). In `Int_ZF_1` we show that integers form a commutative ring. `Int_ZF_2` contains some facts about slopes (almost homomorphisms on integers) needed for real numbers construction, used in `Real_ZF_1`.

In the `IntDiv_ZF_IML` theory we translate some properties of the integer quotient and remainder functions studied in the standard Isabelle's `IntDiv_ZF` theory to the notation used in `IsarMathLib`.

The `Real_ZF` and `Real_ZF_1` theories contain the construction of real numbers based on the paper [2] by R. D. Arthan (not Cauchy sequences, not Dedekind sections). The heavy lifting is done mostly in `Group_ZF_3`, `Ring_ZF_1` and `Int_ZF_2`. `Real_ZF` contains the part of the construction that can be done starting from generic abelian groups (rather than additive group of integers). This allows to show that real numbers form a ring. `Real_ZF_1` continues the construction using properties specific to the integers and showing that real numbers constructed this way form a complete ordered field.

`Cardinal_ZF` provides a couple of theorems about cardinals that are mostly used for studying properties of topological properties (yes, this is kind of meta). The main result (proven without AC) is that if two sets can be injectively mapped into an infinite cardinal, then so can be their union. There is also a definition of the Axiom of Choice specific for a given cardinal (so that the choice function exists for families of sets of given cardinality). Some properties are proven for such predicates, like that for finite families of sets the choice function always exists (in ZF) and that the axiom of choice for a larger cardinal implies one for a smaller cardinal.

`Group_ZF_4` considers conjugate of subgroup and defines simple groups. A nice theorem here is that endomorphisms of an abelian group form a ring.

The first isomorphism theorem (a group homomorphism  $h$  induces an isomorphism between the group divided by the kernel of  $h$  and the image of  $h$ ) is proven.

Turns out given a property of a topological space one can define a local version of a property in general. This is studied in the `Topology_ZF_properties_2` theory and applied to local versions of the property of being finite or compact or Hausdorff (i.e. locally finite, locally compact, locally Hausdorff). There are a couple of nice applications, like one-point compactification that allows to show that every locally compact Hausdorff space is regular. Also there are some results on the interplay between hereditability of a property and local properties.

For a given surjection  $f : X \rightarrow Y$ , where  $X$  is a topological space one can consider the weakest topology on  $Y$  which makes  $f$  continuous, let's call it a quotient topology generated by  $f$ . The quotient topology generated by an equivalence relation  $r$  on  $X$  is actually a special case of this setup, where  $f$  is the natural projection of  $X$  on the quotient  $X/r$ . The properties of these two ways of getting new topologies are studied in `Topology_ZF_8` theory. The main result is that any quotient topology generated by a function is homeomorphic to a topology given by an equivalence relation, so these two approaches to quotient topologies are kind of equivalent.

As we all know, automorphisms of a topological space form a group. This fact is proven in `Topology_ZF_9` and the automorphism groups for co-cardinal, included-set, and excluded-set topologies are identified. For order topologies it is shown that order isomorphisms are homeomorphisms of the topology induced by the order. Properties preserved by continuous functions are studied and as an application it is shown for example that quotient topological spaces of compact (or connected) spaces are compact (or connected, resp.)

The `Topology_ZF_10` theory is about products of two topological spaces. It is proven that if two spaces are  $T_0$  (or  $T_1$ ,  $T_2$ , regular, connected) then their product is as well.

Given a total order on a set one can define a natural topology on it generated by taking the rays and intervals as the base. The `Topology_ZF_11` theory studies relations between the order and various properties of generated topology. For example one can show that if the order topology is connected, then the order is complete (in the sense that for each set bounded from above the set of upper bounds has a minimum). For a given cardinal  $\kappa$  we can consider generalized notion of  $\kappa$ -separability. Turns out  $\kappa$ -separability is related to (order) density of sets of cardinality  $\kappa$  for order topologies.

Being a topological group imposes additional structure on the topology of the group, in particular its separation properties. In `Topological_Group_ZF_1.thy` theory it is shown that if a topology is  $T_0$ , then it must be  $T_3$ , and that the topology in a topological group is always regular.

For a given normal subgroup of a topological group we can define a topology on the quotient group in a natural way. At the end of the `Topological_Group_ZF_2.thy` theory it is shown that such topology on the quotient group makes it a topological group.

The `Topological_Group_ZF_3.thy` theory studies the topologies on subgroups of a topological group. A couple of nice basic properties are shown, like that the closure of a subgroup is a subgroup, closure of a normal subgroup is normal and, a bit more surprising (to me) property that every locally-compact subgroup of a  $T_0$  group is closed.

In `Complex_ZF` we construct complex numbers starting from a complete ordered field (a model of real numbers). We also define the notation for writing about complex numbers and prove that the structure of complex numbers constructed there satisfies the axioms of complex numbers used in `Metamath`.

`MMI_prelude` defines the `mmisar0` context in which most theorems translated from `Metamath` are proven. It also contains a chapter explaining how the translation works.

In the `Metamath_interface` theory we prove a theorem that the `mmisar0` context is valid (can be used) in the `complex0` context. All theories using the translated results will import the `Metamath_interface` theory. The `Metamath_sampler` theory provides some examples of using the translated theorems in the `complex0` context.

The theories `MMI_logic_and_sets`, `MMI_Complex`, `MMI_Complex_1` and `MMI_Complex_2` contain the theorems imported from the `Metamath's` `set.mm` database. As the translated proofs are rather verbose these theories are not printed in this proof document. The full list of translated facts can be found in the `Metamath_theorems.txt` file included in the `IsarMathLib` distribution. The `MMI_examples` provides some theorems imported from `Metamath` that are printed in this proof document as examples of how translated proofs look like.

## 2 Fol1.thy

**theory** Fol1 **imports** Tranc1

**begin**

Isabelle/ZF builds on the first order logic. Almost everything one would like to have in this area is covered in the standard Isabelle libraries. The material in this theory provides some lemmas that are missing or allow for a more readable proof style.

### 2.1 Notions and lemmas in FOL

This section contains mostly shortcuts and workarounds that allow to use more readable coding style.

The next lemma serves as a workaround to problems with applying the definition of transitivity (of a relation) in our coding style (any attempt to do something like `using trans_def` results up Isabelle in an infinite loop).

```
lemma Fol1_L2: assumes
  A1:  $\forall x\ y\ z. \langle x, y \rangle \in r \wedge \langle y, z \rangle \in r \longrightarrow \langle x, z \rangle \in r$ 
shows  $\text{trans}(r)$ 
proof -
  from A1 have
     $\forall x\ y\ z. \langle x, y \rangle \in r \longrightarrow \langle y, z \rangle \in r \longrightarrow \langle x, z \rangle \in r$ 
    using imp_conj by blast
  then show thesis unfolding trans_def by blast
qed
```

Another workaround for the problem of Isabelle simplifier looping when the transitivity definition is used.

```
lemma Fol1_L3: assumes A1:  $\text{trans}(r)$  and A2:  $\langle a, b \rangle \in r \wedge \langle b, c \rangle \in r$ 
shows  $\langle a, c \rangle \in r$ 
proof -
  from A1 have  $\forall x\ y\ z. \langle x, y \rangle \in r \longrightarrow \langle y, z \rangle \in r \longrightarrow \langle x, z \rangle \in r$ 
    unfolding trans_def by blast
  with A2 show thesis using imp_conj by fast
qed
```

There is a problem with application of the definition of asymmetry for relations. The next lemma is a workaround.

```
lemma Fol1_L4:
  assumes A1:  $\text{antisym}(r)$  and A2:  $\langle a, b \rangle \in r \wedge \langle b, a \rangle \in r$ 
shows  $a=b$ 
proof -
  from A1 have  $\forall x\ y. \langle x, y \rangle \in r \longrightarrow \langle y, x \rangle \in r \longrightarrow x=y$ 
    unfolding antisym_def by blast
```

```

    with A2 show a=b using imp_conj by fast
qed

```

The definition below implements a common idiom that states that (perhaps under some assumptions) exactly one of given three statements is true.

**definition**

```

Exactly_1_of_3_holds(p,q,r)  $\equiv$ 
  (p $\vee$ q $\vee$ r)  $\wedge$  (p  $\longrightarrow$   $\neg$ q  $\wedge$   $\neg$ r)  $\wedge$  (q  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ r)  $\wedge$  (r  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ q)

```

The next lemma allows to prove statements of the form Exactly\_1\_of\_3\_holds(p,q,r).

**lemma** Fol1\_L5:

```

  assumes p $\vee$ q $\vee$ r
  and p  $\longrightarrow$   $\neg$ q  $\wedge$   $\neg$ r
  and q  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ r
  and r  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ q
  shows Exactly_1_of_3_holds(p,q,r)
proof -
  from assms have
    (p $\vee$ q $\vee$ r)  $\wedge$  (p  $\longrightarrow$   $\neg$ q  $\wedge$   $\neg$ r)  $\wedge$  (q  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ r)  $\wedge$  (r  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ q)
  by blast
  then show Exactly_1_of_3_holds (p,q,r)
    unfolding Exactly_1_of_3_holds_def by fast
qed

```

If exactly one of  $p, q, r$  holds and  $p$  is not true, then  $q$  or  $r$ .

**lemma** Fol1\_L6:

```

  assumes A1:  $\neg$ p and A2: Exactly_1_of_3_holds(p,q,r)
  shows q $\vee$ r
proof -
  from A2 have
    (p $\vee$ q $\vee$ r)  $\wedge$  (p  $\longrightarrow$   $\neg$ q  $\wedge$   $\neg$ r)  $\wedge$  (q  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ r)  $\wedge$  (r  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ q)
  unfolding Exactly_1_of_3_holds_def by fast
  hence p  $\vee$  q  $\vee$  r by blast
  with A1 show q  $\vee$  r by simp
qed

```

If exactly one of  $p, q, r$  holds and  $q$  is true, then  $r$  can not be true.

**lemma** Fol1\_L7:

```

  assumes A1: q and A2: Exactly_1_of_3_holds(p,q,r)
  shows  $\neg$ r
proof -
  from A2 have
    (p $\vee$ q $\vee$ r)  $\wedge$  (p  $\longrightarrow$   $\neg$ q  $\wedge$   $\neg$ r)  $\wedge$  (q  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ r)  $\wedge$  (r  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ q)
  unfolding Exactly_1_of_3_holds_def by fast
  with A1 show  $\neg$ r by blast
qed

```

The next lemma demonstrates an elegant form of the Exactly\_1\_of\_3\_holds(p,q,r) predicate. More on that at [www.solcon.nl/mklooster/calc/calc-tri.html](http://www.solcon.nl/mklooster/calc/calc-tri.html).

```

lemma Fol1_L8:
  shows Exactly_1_of_3_holds(p,q,r)  $\longleftrightarrow$  (p $\longleftrightarrow$ q $\longleftrightarrow$ r)  $\wedge$   $\neg$ (p $\wedge$ q $\wedge$ r)
proof
  assume Exactly_1_of_3_holds(p,q,r)
  then have
    (p $\vee$ q $\vee$ r)  $\wedge$  (p  $\longrightarrow$   $\neg$ q  $\wedge$   $\neg$ r)  $\wedge$  (q  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ r)  $\wedge$  (r  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ q)
    unfolding Exactly_1_of_3_holds_def by fast
  thus (p $\longleftrightarrow$ q $\longleftrightarrow$ r)  $\wedge$   $\neg$ (p $\wedge$ q $\wedge$ r) by blast
next assume (p $\longleftrightarrow$ q $\longleftrightarrow$ r)  $\wedge$   $\neg$ (p $\wedge$ q $\wedge$ r)
  hence
    (p $\vee$ q $\vee$ r)  $\wedge$  (p  $\longrightarrow$   $\neg$ q  $\wedge$   $\neg$ r)  $\wedge$  (q  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ r)  $\wedge$  (r  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ q)
    by auto
  then show Exactly_1_of_3_holds(p,q,r)
    unfolding Exactly_1_of_3_holds_def by fast
qed

```

A property of the Exactly\_1\_of\_3\_holds predicate.

```

lemma Fol1_L8A: assumes A1: Exactly_1_of_3_holds(p,q,r)
  shows p  $\longleftrightarrow$   $\neg$ (q  $\vee$  r)
proof -
  from A1 have (p $\vee$ q $\vee$ r)  $\wedge$  (p  $\longrightarrow$   $\neg$ q  $\wedge$   $\neg$ r)  $\wedge$  (q  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ r)  $\wedge$  (r  $\longrightarrow$ 
 $\neg$ p  $\wedge$   $\neg$ q)
    unfolding Exactly_1_of_3_holds_def by fast
  then show p  $\longleftrightarrow$   $\neg$ (q  $\vee$  r) by blast
qed

```

Exclusive or definition. There is one also defined in the standard Isabelle, denoted xor, but it relates to boolean values, which are sets. Here we define a logical functor.

```

definition
  Xor (infixl Xor 66) where
    p Xor q  $\equiv$  (p $\vee$ q)  $\wedge$   $\neg$ (p  $\wedge$  q)

```

The "exclusive or" is the same as negation of equivalence.

```

lemma Fol1_L9: shows p Xor q  $\longleftrightarrow$   $\neg$ (p $\longleftrightarrow$ q)
  using Xor_def by auto

```

Equivalence relations are symmetric.

```

lemma equiv_is_sym: assumes A1: equiv(X,r) and A2:  $\langle$ x,y $\rangle \in$  r
  shows  $\langle$ y,x $\rangle \in$  r
proof -
  from A1 have sym(r) using equiv_def by simp
  then have  $\forall$ x y.  $\langle$ x,y $\rangle \in$  r  $\longrightarrow$   $\langle$ y,x $\rangle \in$  r
    unfolding sym_def by fast
  with A2 show  $\langle$ y,x $\rangle \in$  r by blast
qed

```

end

### 3 ZF1.thy

**theory** ZF1 **imports** equalities

**begin**

Standard Isabelle distribution contains lots of facts about basic set theory.  
This theory file adds some more.

#### 3.1 Lemmas in Zermelo-Fraenkel set theory

Here we put lemmas from the set theory that we could not find in the standard Isabelle distribution.

If one collection is contained in another, then we can say the same about their unions.

```
lemma collection_contain: assumes  $A \subseteq B$  shows  $\bigcup A \subseteq \bigcup B$   
proof  
  fix  $x$  assume  $x \in \bigcup A$   
  then obtain  $X$  where  $x \in X$  and  $X \in A$  by auto  
  with assms show  $x \in \bigcup B$  by auto  
qed
```

If all sets of a nonempty collection are the same, then its union is the same.

```
lemma ZF1_1_L1: assumes  $C \neq 0$  and  $\forall y \in C. b(y) = A$   
  shows  $(\bigcup_{y \in C} b(y)) = A$  using assms by blast
```

The union of all values of a constant meta-function belongs to the same set as the constant.

```
lemma ZF1_1_L2: assumes  $A1: C \neq 0$  and  $A2: \forall x \in C. b(x) \in A$   
  and  $A3: \forall x y. x \in C \wedge y \in C \longrightarrow b(x) = b(y)$   
  shows  $(\bigcup_{x \in C} b(x)) \in A$   
proof -  
  from  $A1$  obtain  $x$  where  $D1: x \in C$  by auto  
  with  $A3$  have  $\forall y \in C. b(y) = b(x)$  by blast  
  with  $A1$  have  $(\bigcup_{y \in C} b(y)) = b(x)$   
    using ZF1_1_L1 by simp  
  with  $D1$   $A2$  show thesis by simp  
qed
```

If two meta-functions are the same on a cartesian product, then the subsets defined by them are the same. I am surprised Isabelle can not handle this automatically.

```
lemma ZF1_1_L4: assumes  $A1: \forall x \in X. \forall y \in Y. a(x,y) = b(x,y)$   
  shows  $\{a(x,y). \langle x,y \rangle \in X \times Y\} = \{b(x,y). \langle x,y \rangle \in X \times Y\}$   
proof  
  show  $\{a(x,y). \langle x,y \rangle \in X \times Y\} \subseteq \{b(x,y). \langle x,y \rangle \in X \times Y\}$ 
```

```

proof
  fix z assume z ∈ {a(x, y) . ⟨x,y⟩ ∈ X × Y}
  with A1 show z ∈ {b(x,y).⟨x,y⟩ ∈ X×Y} by auto
qed
show {b(x, y) . ⟨x,y⟩ ∈ X × Y} ⊆ {a(x, y) . ⟨x,y⟩ ∈ X × Y}
proof
  fix z assume z ∈ {b(x, y) . ⟨x,y⟩ ∈ X × Y}
  with A1 show z ∈ {a(x,y).⟨x,y⟩ ∈ X×Y} by auto
qed
qed

```

If two meta-functions are the same on a cartesian product, then the subsets defined by them are the same. This is similar to ZF1\_1\_L4, except that the set definition varies over  $p \in X \times Y$  rather than  $\langle x, y \rangle \in X \times Y$ .

```

lemma ZF1_1_L4A: assumes A1:  $\forall x \in X. \forall y \in Y. a(\langle x, y \rangle) = b(x, y)$ 
  shows {a(p) . p ∈ X×Y} = {b(x,y) . ⟨x,y⟩ ∈ X×Y}
proof
  { fix z assume z ∈ {a(p) . p ∈ X×Y}
    then obtain p where D1: z=a(p) p ∈ X×Y by auto
    let x = fst(p) let y = snd(p)
    from A1 D1 have z ∈ {b(x,y) . ⟨x,y⟩ ∈ X×Y} by auto
  } then show {a(p) . p ∈ X×Y} ⊆ {b(x,y) . ⟨x,y⟩ ∈ X×Y} by blast
next
  { fix z assume z ∈ {b(x,y) . ⟨x,y⟩ ∈ X×Y}
    then obtain x y where D1: ⟨x,y⟩ ∈ X×Y z=b(x,y) by auto
    let p = ⟨ x,y⟩
    from A1 D1 have p ∈ X×Y z = a(p) by auto
    then have z ∈ {a(p) . p ∈ X×Y} by auto
  } then show {b(x,y) . ⟨x,y⟩ ∈ X×Y} ⊆ {a(p) . p ∈ X×Y} by blast
qed

```

A lemma about inclusion in cartesian products. Included here to remember that we need the  $U \times V \neq \emptyset$  assumption.

```

lemma prod_subset: assumes  $U \times V \neq \emptyset$   $U \times V \subseteq X \times Y$  shows  $U \subseteq X$  and  $V \subseteq Y$ 
  using assms by auto

```

A technical lemma about sections in cartesian products.

```

lemma section_proj: assumes  $A \subseteq X \times Y$  and  $U \times V \subseteq A$  and  $x \in U$   $y \in V$ 
  shows  $U \subseteq \{t \in X. \langle t, y \rangle \in A\}$  and  $V \subseteq \{t \in Y. \langle x, t \rangle \in A\}$ 
  using assms by auto

```

If two meta-functions are the same on a set, then they define the same set by separation.

```

lemma ZF1_1_L4B: assumes  $\forall x \in X. a(x) = b(x)$ 
  shows {a(x) . x ∈ X} = {b(x) . x ∈ X}
  using assms by simp

```

A set defined by a constant meta-function is a singleton.

**lemma** ZF1\_1\_L5: **assumes**  $X \neq 0$  **and**  $\forall x \in X. b(x) = c$   
**shows**  $\{b(x). x \in X\} = \{c\}$  **using** **assms** **by** **blast**

Most of the time, auto does this job, but there are strange cases when the next lemma is needed.

**lemma** subset\_with\_property: **assumes**  $Y = \{x \in X. b(x)\}$   
**shows**  $Y \subseteq X$   
**using** **assms** **by** **auto**

We can choose an element from a nonempty set.

**lemma** nonempty\_has\_element: **assumes**  $X \neq 0$  **shows**  $\exists x. x \in X$   
**using** **assms** **by** **auto**

In Isabelle/ZF the intersection of an empty family is empty. This is exactly lemma *Inter\_0* from Isabelle's equalities theory. We repeat this lemma here as it is very difficult to find. This is one reason we need comments before every theorem: so that we can search for keywords.

**lemma** inter\_empty\_empty: **shows**  $\bigcap 0 = 0$  **by** (rule *Inter\_0*)

If an intersection of a collection is not empty, then the collection is not empty. We are (ab)using the fact the the intesection of empty collection is defined to be empty.

**lemma** inter\_nempty\_nempty: **assumes**  $\bigcap A \neq 0$  **shows**  $A \neq 0$   
**using** **assms** **by** **auto**

For two collections  $S, T$  of sets we define the product collection as the collections of cartesian products  $A \times B$ , where  $A \in S, B \in T$ .

**definition**

$\text{ProductCollection}(T, S) \equiv \bigcup U \in T. \{U \times V. V \in S\}$

The union of the product collection of collections  $S, T$  is the cartesian product of  $\bigcup S$  and  $\bigcup T$ .

**lemma** ZF1\_1\_L6: **shows**  $\bigcup \text{ProductCollection}(S, T) = \bigcup S \times \bigcup T$   
**using** *ProductCollection\_def* **by** **auto**

An intersection of subsets is a subset.

**lemma** ZF1\_1\_L7: **assumes**  $A1: I \neq 0$  **and**  $A2: \forall i \in I. P(i) \subseteq X$   
**shows**  $(\bigcap i \in I. P(i)) \subseteq X$

**proof** -

**from**  $A1$  **obtain**  $i_0$  **where**  $i_0 \in I$  **by** **auto**  
**with**  $A2$  **have**  $(\bigcap i \in I. P(i)) \subseteq P(i_0)$  **and**  $P(i_0) \subseteq X$   
**by** **auto**  
**thus**  $(\bigcap i \in I. P(i)) \subseteq X$  **by** **auto**

**qed**

Isabelle/ZF has a "THE" construct that allows to define an element if there is only one such that is satisfies given predicate. In pure ZF we can express something similar using the indentity proven below.

lemma ZF1\_1\_L8: shows  $\bigcup \{x\} = x$  by auto

Some properties of singletons.

lemma ZF1\_1\_L9: assumes A1:  $\exists! x. x \in A \wedge \varphi(x)$

shows

$\exists a. \{x \in A. \varphi(x)\} = \{a\}$

$\bigcup \{x \in A. \varphi(x)\} \in A$

$\varphi(\bigcup \{x \in A. \varphi(x)\})$

proof -

from A1 show  $\exists a. \{x \in A. \varphi(x)\} = \{a\}$  by auto

then obtain a where I:  $\{x \in A. \varphi(x)\} = \{a\}$  by auto

then have  $\bigcup \{x \in A. \varphi(x)\} = a$  by auto

moreover

from I have  $a \in \{x \in A. \varphi(x)\}$  by simp

hence  $a \in A$  and  $\varphi(a)$  by auto

ultimately show  $\bigcup \{x \in A. \varphi(x)\} \in A$  and  $\varphi(\bigcup \{x \in A. \varphi(x)\})$

by auto

qed

A simple version of ZF1\_1\_L9.

corollary singleton\_extract: assumes  $\exists! x. x \in A$

shows  $(\bigcup A) \in A$

proof -

from assms have  $\exists! x. x \in A \wedge \text{True}$  by simp

then have  $\bigcup \{x \in A. \text{True}\} \in A$  by (rule ZF1\_1\_L9)

thus  $(\bigcup A) \in A$  by simp

qed

A criterion for when a set defined by comprehension is a singleton.

lemma singleton\_comprehension:

assumes A1:  $y \in X$  and A2:  $\forall x \in X. \forall y \in X. P(x) = P(y)$

shows  $(\bigcup \{P(x). x \in X\}) = P(y)$

proof -

let  $A = \{P(x). x \in X\}$

have  $\exists! c. c \in A$

proof

from A1 show  $\exists c. c \in A$  by auto

next

fix a b assume  $a \in A$  and  $b \in A$

then obtain x t where

$x \in X$   $a = P(x)$  and  $t \in X$   $b = P(t)$

by auto

with A2 show  $a=b$  by blast

qed

then have  $(\bigcup A) \in A$  by (rule singleton\_extract)

then obtain x where  $x \in X$  and  $(\bigcup A) = P(x)$

from A1 A2 ' $x \in X$ ' have  $P(x) = P(y)$

by blast

```

  with '( $\bigcup A$ ) = P(x)' show ( $\bigcup A$ ) = P(y) by simp
qed

```

Adding an element of a set to that set does not change the set.

```

lemma set_elem_add: assumes x∈X shows  $X \cup \{x\} = X$  using assms
  by auto

```

Here we define a restriction of a collection of sets to a given set. In romantic math this is typically denoted  $X \cap M$  and means  $\{X \cap A : A \in M\}$ . Note there is also  $\text{restrict}(f, A)$  defined for relations in ZF.thy.

**definition**

```

  RestrictedTo (infixl {restricted to} 70) where
  M {restricted to} X  $\equiv \{X \cap A \mid A \in M\}$ 

```

A lemma on a union of a restriction of a collection to a set.

```

lemma union_restrict:
  shows  $\bigcup (M \text{ restricted to } X) = (\bigcup M) \cap X$ 
  using RestrictedTo_def by auto

```

Next we show a technical identity that is used to prove sufficiency of some condition for a collection of sets to be a base for a topology.

```

lemma ZF1_1_L10: assumes A1:  $\forall U \in C. \exists A \in B. U = \bigcup A$ 
  shows  $\bigcup \bigcup \{ \bigcup \{ A \in B \mid U = \bigcup A \} \mid U \in C \} = \bigcup C$ 

```

**proof**

```

  show  $\bigcup (\bigcup U \in C. \bigcup \{ A \in B \mid U = \bigcup A \}) \subseteq \bigcup C$  by blast
  show  $\bigcup C \subseteq \bigcup (\bigcup U \in C. \bigcup \{ A \in B \mid U = \bigcup A \})$ 

```

**proof**

```

  fix x assume x ∈  $\bigcup C$ 

```

```

  show x ∈  $\bigcup (\bigcup U \in C. \bigcup \{ A \in B \mid U = \bigcup A \})$ 

```

**proof -**

```

  from 'x ∈  $\bigcup C$ ' obtain U where  $U \in C \wedge x \in U$  by auto

```

```

  with A1 obtain A where  $A \in B \wedge U = \bigcup A$  by auto

```

```

  shows a $\in$ X and p(a) using assms by auto
end

```

## 4 Nat\_ZF.thy

```
theory Nat_ZF_IML imports Arith
```

```
begin
```

The ZF set theory constructs natural numbers from the empty set and the notion of a one-element set. Namely, zero of natural numbers is defined as the empty set. For each natural number  $n$  the next natural number is defined as  $n \cup \{n\}$ . With this definition for every non-zero natural number we get the identity  $n = \{0, 1, 2, \dots, n-1\}$ . It is good to remember that when we see an expression like  $f : n \rightarrow X$ . Also, with this definition the relation "less or equal than" becomes " $\subseteq$ " and the relation "less than" becomes " $\in$ ".

### 4.1 Induction

The induction lemmas in the standard Isabelle's Nat.thy file like for example `nat_induct` require the induction step to be a higher order statement (the one that uses the  $\implies$  sign). I found it difficult to apply from Isar, which is perhaps more of an indication of my Isar skills than anything else. Anyway, here we provide a first order version that is easier to reference in Isar declarative style proofs.

The next theorem is a version of induction on natural numbers that I was thought in school.

```
theorem ind_on_nat:
  assumes A1:  $n \in \text{nat}$  and A2:  $P(0)$  and A3:  $\forall k \in \text{nat}. P(k) \implies P(\text{succ}(k))$ 
  shows  $P(n)$ 
proof -
  note A1 A2
  moreover
  { fix x
    assume  $x \in \text{nat}$   $P(x)$ 
    with A3 have  $P(\text{succ}(x))$  by simp }
  ultimately show  $P(n)$  by (rule nat_induct)
qed
```

A nonzero natural number has a predecessor.

```
lemma Nat_ZF_1_L3: assumes A1:  $n \in \text{nat}$  and A2:  $n \neq 0$ 
  shows  $\exists k \in \text{nat}. n = \text{succ}(k)$ 
proof -
  from A1 have  $n \in \{0\} \cup \{\text{succ}(k). k \in \text{nat}\}$ 
    using nat_unfold by simp
  with A2 show thesis by simp
qed
```

What is `succ`, anyway?

```
lemma succ_explained: shows succ(n) = n ∪ {n}
  using succ_iff by auto

## 4.2 Intervals

In this section we consider intervals of natural numbers i.e. sets of the form  $\{n + j : j \in 0..k - 1\}$ .

The interval is determined by two parameters: starting point and length. Recall that in standard Isabelle's `Arith.thy` the symbol `#+` is defined as the sum of natural numbers.

**definition**

$$\text{NatInterval}(n, k) \equiv \{n \#+ j. j \in k\}$$

Subtracting the beginning of the interval results in a number from the length of the interval. It may sound weird, but note that the length of such interval is a natural number, hence a set.

```

lemma inter_diff_in_len:
  assumes A1:  $k \in \text{nat}$  and A2:  $i \in \text{NatInterval}(n, k)$ 
shows  $i \#- n \in k$ 
proof -
  from A2 obtain j where I:  $i = n \#+ j$  and II:  $j \in k$ 
    using NatInterval_def by auto
  from A1 II have  $j \in \text{nat}$  using elem_nat_is_nat by blast
  moreover from I have  $i \#- n = \text{nativify}(j)$  using diff_add_inverse
    by simp
  ultimately have  $i \#- n = j$  by simp
  with II show thesis by simp

n #+ k #+ m = n ∪ NatInterval(n,k #+ m)
n #+ k #+ m = n ∪ NatInterval(n,k) ∪ NatInterval(n #+ k,m)
using assms add_assoc length_start_decomp by auto

```

end

## 5 Order\_ZF.thy

**theory** Order\_ZF **imports** Fol1

**begin**

This theory file considers various notion related to order. We redefine the notions of a total order, linear order and partial order to have the same terminology as Wikipedia (I found it very consistent across different areas of math). We also define and study the notions of intervals and bounded sets. We show the inclusion relations between the intervals with endpoints being in certain order. We also show that union of bounded sets are bounded. This allows to show in `Finite_ZF.thy` that finite sets are bounded.

### 5.1 Definitions

In this section we formulate the definitions related to order relations.

A relation  $r$  is "total" on a set  $X$  if for all elements  $a, b$  of  $X$  we have  $a$  is in relation with  $b$  or  $b$  is in relation with  $a$ . An example is the  $\leq$  relation on numbers.

**definition**

`IsTotal (infixl {is total on} 65) where`  
`r {is total on} X  $\equiv$  ( $\forall a \in X. \forall b \in X. \langle a, b \rangle \in r \vee \langle b, a \rangle \in r$ )`

A relation  $r$  is a partial order on  $X$  if it is reflexive on  $X$  (i.e.  $\langle x, x \rangle$  for every  $x \in X$ ), antisymmetric (if  $\langle x, y \rangle \in r$  and  $\langle y, x \rangle \in r$ , then  $x = y$ ) and transitive ( $\langle x, y \rangle \in r$  and  $\langle y, z \rangle \in r$  implies  $\langle x, z \rangle \in r$ ).

**definition**

`IsPartOrder(X,r)  $\equiv$  (refl(X,r)  $\wedge$  antisym(r)  $\wedge$  trans(r))`

We define a linear order as a binary relation that is antisymmetric, transitive and total. Note that this terminology is different than the one used the standard `Order.thy` file.

**definition**

`IsLinOrder(X,r)  $\equiv$  ( antisym(r)  $\wedge$  trans(r)  $\wedge$  (r {is total on} X))`

A set is bounded above if there is that is an upper bound for it, i.e. there are some  $u$  such that  $\langle x, u \rangle \in r$  for all  $x \in A$ . In addition, the empty set is defined as bounded.

**definition**

`IsBoundedAbove(A,r)  $\equiv$  ( A=0  $\vee$  ( $\exists u. \forall x \in A. \langle x, u \rangle \in r$ ))`

We define sets bounded below analogously.

**definition**

`IsBoundedBelow(A,r)  $\equiv$  (A=0  $\vee$  ( $\exists l. \forall x \in A. \langle l, x \rangle \in r$ ))`

A set is bounded if it is bounded below and above.

**definition**

$$\text{IsBounded}(A, r) \equiv (\text{IsBoundedAbove}(A, r) \wedge \text{IsBoundedBelow}(A, r))$$

The notation for the definition of an interval may be mysterious for some readers, see lemma `Order_ZF_2_L1` for more intuitive notation.

**definition**

$$\text{Interval}(r, a, b) \equiv r\{a\} \cap r-\{b\}$$

We also define the maximum (the greater of) two elements in the obvious way.

**definition**

$$\text{GreaterOf}(r, a, b) \equiv (\text{if } \langle a, b \rangle \in r \text{ then } b \text{ else } a)$$

The definition of a minimum (the smaller of) two elements.

**definition**

$$\text{SmallerOf}(r, a, b) \equiv (\text{if } \langle a, b \rangle \in r \text{ then } a \text{ else } b)$$

We say that a set has a maximum if it has an element that is not smaller than any other one. We show that under some conditions this element of the set is unique (if exists).

**definition**

$$\text{HasAmaximum}(r, A) \equiv \exists M \in A. \forall x \in A. \langle x, M \rangle \in r$$

A similar definition what it means that a set has a minimum.

**definition**

$$\text{HasAminimum}(r, A) \equiv \exists m \in A. \forall x \in A. \langle m, x \rangle \in r$$

Definition of the maximum of a set.

**definition**

$$\text{Maximum}(r, A) \equiv \text{THE } M. M \in A \wedge (\forall x \in A. \langle x, M \rangle \in r)$$

Definition of a minimum of a set.

**definition**

$$\text{Minimum}(r, A) \equiv \text{THE } m. m \in A \wedge (\forall x \in A. \langle m, x \rangle \in r)$$

The supremum of a set  $A$  is defined as the minimum of the set of upper bounds, i.e. the set  $\{u. \forall a \in A. \langle a, u \rangle \in r\} = \bigcap_{a \in A} r\{a\}$ . Recall that in Isabelle/ZF  $r-(A)$  denotes the inverse image of the set  $A$  by relation  $r$  (i.e.  $r-(A) = \{x : \langle x, y \rangle \in r \text{ for some } y \in A\}$ ).

**definition**

$$\text{Supremum}(r, A) \equiv \text{Minimum}(r, \bigcap_{a \in A} r\{a\})$$

Infimum is defined analogously.

**definition**

$$\text{Infimum}(r, A) \equiv \text{Maximum}(r, \bigcap_{a \in A} r-\{a\})$$

We define a relation to be complete if every nonempty bounded above set has a supremum.

**definition**

`IsComplete` (`_ {is complete}`) **where**  
`r {is complete}`  $\equiv$   
 $\forall A. \text{IsBoundedAbove}(A, r) \wedge A \neq \emptyset \longrightarrow \text{HasAminimum}(r, \bigcap_{a \in A} r-\{a\})$

The essential condition to show that a total relation is reflexive.

**lemma** `Order_ZF_1_L1`: **assumes** `r {is total on} X` **and** `a ∈ X`  
**shows** `⟨a, a⟩ ∈ r` **using** `assms IsTotal_def` **by** `auto`

A total relation is reflexive.

**lemma** `total_is_refl`:  
**assumes** `r {is total on} X`  
**shows** `refl(X, r)` **using** `assms Order_ZF_1_L1 refl_def` **by** `simp`

A linear order is partial order.

**lemma** `Order_ZF_1_L2`: **assumes** `IsLinOrder(X, r)`  
**shows** `IsPartOrder(X, r)`  
**using** `assms IsLinOrder_def IsPartOrder_def refl_def Order_ZF_1_L1`  
**by** `auto`

Partial order that is total is linear.

**lemma** `Order_ZF_1_L3`:  
**assumes** `IsPartOrder(X, r)` **and** `r {is total on} X`  
**shows** `IsLinOrder(X, r)`  
**using** `assms IsPartOrder_def IsLinOrder_def`  
**by** `simp`

Relation that is total on a set is total on any subset.

**lemma** `Order_ZF_1_L4`: **assumes** `r {is total on} X` **and** `A ⊆ X`  
**shows** `r {is total on} A`  
**using** `assms IsTotal_def` **by** `auto`

A linear relation is linear on any subset.

**lemma** `ord_linear_subset`: **assumes** `IsLinOrder(X, r)` **and** `A ⊆ X`  
**shows** `IsLinOrder(A, r)`  
**using** `assms IsLinOrder_def Order_ZF_1_L4` **by** `blast`

If the relation is total, then every set is a union of those elements that are nongreater than a given one and nonsmaller than a given one.

**lemma** `Order_ZF_1_L5`:  
**assumes** `r {is total on} X` **and** `A ⊆ X` **and** `a ∈ X`  
**shows** `A = {x ∈ A. ⟨x, a⟩ ∈ r} ∪ {x ∈ A. ⟨a, x⟩ ∈ r}`  
**using** `assms IsTotal_def` **by** `auto`

A technical fact about reflexive relations.

```
lemma refl_add_point:
  assumes refl(X,r) and A ⊆ B ∪ {x} and B ⊆ X and
  x ∈ X and ∀y∈B. ⟨y,x⟩ ∈ r
  shows ∀a∈A. ⟨a,x⟩ ∈ r
  using assms refl_def by auto
```

## 5.2 Intervals

In this section we discuss intervals.

The next lemma explains the notation of the definition of an interval.

```
lemma Order_ZF_2_L1:
  shows x ∈ Interval(r,a,b) ⟷ ⟨ a,x⟩ ∈ r ∧ ⟨ x,b⟩ ∈ r
  using Interval_def by auto
```

Since there are some problems with applying the above lemma (seems that simp and auto don't handle equivalence very well), we split `Order_ZF_2_L1` into two lemmas.

```
lemma Order_ZF_2_L1A: assumes x ∈ Interval(r,a,b)
  shows ⟨ a,x⟩ ∈ r  ⟨ x,b⟩ ∈ r
  using assms Order_ZF_2_L1 by auto
```

`Order_ZF_2_L1`, implication from right to left.

```
lemma Order_ZF_2_L1B: assumes ⟨ a,x⟩ ∈ r  ⟨ x,b⟩ ∈ r
  shows x ∈ Interval(r,a,b)
  using assms Order_ZF_2_L1 by simp
```

If the relation is reflexive, the endpoints belong to the interval.

```
lemma Order_ZF_2_L2: assumes refl(X,r)
  and a∈X  b∈X and ⟨ a,b⟩ ∈ r
  shows
  a ∈ Interval(r,a,b)
  b ∈ Interval(r,a,b)
  using assms refl_def Order_ZF_2_L1 by auto
```

Under the assumptions of `Order_ZF_2_L2`, the interval is nonempty.

```
lemma Order_ZF_2_L2A: assumes refl(X,r)
  and a∈X  b∈X and ⟨ a,b⟩ ∈ r
  shows Interval(r,a,b) ≠ 0
```

**proof -**

```
  from assms have a ∈ Interval(r,a,b)
    using Order_ZF_2_L2 by simp
  then show Interval(r,a,b) ≠ 0 by auto
```

**qed**

If  $a, b, c, d$  are in this order, then  $[b, c] \subseteq [a, d]$ . We only need transitivity for this to be true.

```

lemma Order_ZF_2_L3:
  assumes A1: trans(r) and A2:  $\langle a,b \rangle \in r \ \langle b,c \rangle \in r \ \langle c,d \rangle \in r$ 
  shows Interval(r,b,c)  $\subseteq$  Interval(r,a,d)
proof
  fix x assume A3:  $x \in \text{Interval}(r, b, c)$ 
  note A1
  moreover from A2 A3 have  $\langle a,b \rangle \in r \wedge \langle b,x \rangle \in r$  using Order_ZF_2_L1A
  by simp
  ultimately have T1:  $\langle a,x \rangle \in r$  by (rule Fol1_L3)
  note A1
  moreover from A2 A3 have  $\langle x,c \rangle \in r \wedge \langle c,d \rangle \in r$  using Order_ZF_2_L1A
  by simp
  ultimately have  $\langle x,d \rangle \in r$  by (rule Fol1_L3)
  with T1 show  $x \in \text{Interval}(r,a,d)$  using Order_ZF_2_L1B
  by simp
qed

```

For reflexive and antisymmetric relations the interval with equal endpoints consists only of that endpoint.

```

lemma Order_ZF_2_L4:
  assumes A1: refl(X,r) and A2: antisym(r) and A3:  $a \in X$ 
  shows Interval(r,a,a) = {a}
proof
  from A1 A3 have  $\langle a,a \rangle \in r$  using refl_def by simp
  with A1 A3 show {a}  $\subseteq$  Interval(r,a,a) using Order_ZF_2_L2 by simp
  from A2 show Interval(r,a,a)  $\subseteq$  {a} using Order_ZF_2_L1A Fol1_L4
  by fast
qed

```

For transitive relations the endpoints have to be in the relation for the interval to be nonempty.

```

lemma Order_ZF_2_L5: assumes A1: trans(r) and A2:  $\langle a,b \rangle \notin r$ 
  shows Interval(r,a,b) = 0
proof -
  { assume Interval(r,a,b)  $\neq$  0 then obtain x where  $x \in \text{Interval}(r,a,b)$ 
    by auto
    with A1 A2 have False using Order_ZF_2_L1A Fol1_L3 by fast
  } thus thesis by auto
qed

```

If a relation is defined on a set, then intervals are subsets of that set.

```

lemma Order_ZF_2_L6: assumes A1:  $r \subseteq X \times X$ 
  shows Interval(r,a,b)  $\subseteq X$ 
  using assms Interval_def by auto

```

### 5.3 Bounded sets

In this section we consider properties of bounded sets.

For reflexive relations singletons are bounded.

```
lemma Order_ZF_3_L1: assumes refl(X,r) and a∈X
  shows IsBounded({a},r)
  using assms refl_def IsBoundedAbove_def IsBoundedBelow_def
    IsBounded_def by auto
```

Sets that are bounded above are contained in the domain of the relation.

```
lemma Order_ZF_3_L1A: assumes r ⊆ X×X
  and IsBoundedAbove(A,r)
  shows A⊆X using assms IsBoundedAbove_def by auto
```

Sets that are bounded below are contained in the domain of the relation.

```
lemma Order_ZF_3_L1B: assumes r ⊆ X×X
  and IsBoundedBelow(A,r)
  shows A⊆X using assms IsBoundedBelow_def by auto
```

For a total relation, the greater of two elements, as defined above, is indeed greater of any of the two.

```
lemma Order_ZF_3_L2: assumes r {is total on} X
  and x∈X y∈X
  shows
    ⟨x, GreaterOf(r,x,y)⟩ ∈ r
    ⟨y, GreaterOf(r,x,y)⟩ ∈ r
    ⟨SmallerOf(r,x,y), x⟩ ∈ r
    ⟨SmallerOf(r,x,y), y⟩ ∈ r
  using assms IsTotal_def Order_ZF_1_L1 GreaterOf_def SmallerOf_def
    by auto
```

If  $A$  is bounded above by  $u$ ,  $B$  is bounded above by  $w$ , then  $A \cup B$  is bounded above by the greater of  $u, w$ .

```
lemma Order_ZF_3_L2B:
  assumes A1: r {is total on} X and A2: trans(r)
  and A3: u∈X w∈X
  and A4: ∀x∈A. ⟨ x,u⟩ ∈ r ∀x∈B. ⟨ x,w⟩ ∈ r
  shows ∀x∈A∪B. ⟨x, GreaterOf(r,u,w)⟩ ∈ r
```

**proof**

```
  let v = GreaterOf(r,u,w)
  from A1 A3 have T1: ⟨ u,v⟩ ∈ r and T2: ⟨ w,v⟩ ∈ r
    using Order_ZF_3_L2 by auto
  fix x assume A5: x∈A∪B show ⟨x,v⟩ ∈ r
```

**proof -**

```
  { assume x∈A
    with A4 T1 have ⟨ x,u⟩ ∈ r ∧ ⟨ u,v⟩ ∈ r by simp
    with A2 have ⟨x,v⟩ ∈ r by (rule Fol1_L3) }
```

**moreover**

```
{ assume x∉A
  with A5 A4 T2 have ⟨ x,w⟩ ∈ r ∧ ⟨ w,v⟩ ∈ r by simp
  with A2 have ⟨x,v⟩ ∈ r by (rule Fol1_L3) }
```

## 6 Order\_ZF\_1.thy

**theory** Order\_ZF\_1 **imports** Order\_ZF1

**begin**

In `Order_ZF` we define some notions related to order relations based on the nonstrict orders ( $\leq$  type). Some people however prefer to talk about these notions in terms of the strict order relation ( $<$  type). This is the case for the standard Isabelle `Order.thy` and also for Metamath. In this theory file we repeat some developments from `Order_ZF` using the strict order relation as a basis. This is mostly useful for Metamath translation, but is also of some general interest. The names of theorems are copied from Metamath.

### 6.1 Definitions and basic properties

In this section we introduce some definitions taken from Metamath and relate them to the ones used by the standard Isabelle `Order.thy`.

The next definition is the strict version of the linear order. What we write as `R Orders A` is written *ROrdA* in Metamath.

**definition**

`StrictOrder (infix Orders 65) where`

$$\begin{aligned} R \text{ Orders } A &\equiv \forall x \ y \ z. (x \in A \wedge y \in A \wedge z \in A) \longrightarrow \\ &(\langle x, y \rangle \in R \longleftrightarrow \neg(x=y \vee \langle y, x \rangle \in R)) \wedge \\ &(\langle x, y \rangle \in R \wedge \langle y, z \rangle \in R \longrightarrow \langle x, z \rangle \in R) \end{aligned}$$

The definition of supremum for a (strict) linear order.

**definition**

$$\begin{aligned} \text{Sup}(B, A, R) &\equiv \\ &\bigcup \{x \in A. (\forall y \in B. \langle x, y \rangle \notin R) \wedge \\ &(\forall y \in A. \langle y, x \rangle \in R \longrightarrow (\exists z \in B. \langle y, z \rangle \in R))\} \end{aligned}$$

Definition of infimum for a linear order. It is defined in terms of supremum.

**definition**

$$\text{Infim}(B, A, R) \equiv \text{Sup}(B, A, \text{converse}(R))$$

If relation  $R$  orders a set  $A$ , (in Metamath sense) then  $R$  is irreflexive, transitive and linear therefore is a total order on  $A$  (in Isabelle sense).

**lemma** `orders_imp_tot_ord`: `assumes A1: R Orders A`

`shows`

`irrefl(A, R)`  
`trans[A](R)`  
`part_ord(A, R)`  
`linear(A, R)`  
`tot_ord(A, R)`

**proof** -

```

from A1 have I:
   $\forall x y z. (x \in A \wedge y \in A \wedge z \in A) \longrightarrow$ 
   $(\langle x, y \rangle \in R \longleftrightarrow \neg(x=y \vee \langle y, x \rangle \in R)) \wedge$

## 6.2 Properties of (strict) total orders

In this section we discuss the properties of strict order relations. This continues the development contained in the standard Isabelle's `Order.thy` with a view towards using the theorems translated from Metamath.

A relation orders a set iff the converse relation orders a set. Going one way we can use the lemma `tot_ord_converse` from the standard Isabelle's `Order.thy`. The other way is a bit more complicated (note that in Isabelle for  $\text{converse}(\text{converse}(r)) = r$  one needs  $r$  to consist of ordered pairs, which does not follow from the `StrictOrder` definition above).

```

lemma cnvso: shows R Orders A  $\longleftrightarrow$  converse(R) Orders A
proof
  let r = converse(R)
  assume R Orders A
  then have tot_ord(A,r) using orders_imp_tot_ord tot_ord_converse

## 7 Order\_ZF\_1a.thy

**theory** Order\_ZF\_1a **imports** Order\_ZF

**begin**

This theory is a continuation of `Order_ZF` and talks about maxima and minimum of a set, supremum and infimum and strict (not reflexive) versions of order relations.

### 7.1 Maximum and minimum of a set

In this section we show that maximum and minimum are unique if they exist. We also show that union of sets that have maxima (minima) has a maximum (minimum). We also show that singletons have maximum and minimum. All this allows to show (in `Finite_ZF`) that every finite set has well-defined maximum and minimum.

For antisymmetric relations maximum of a set is unique if it exists.

**lemma** Order\_ZF\_4\_L1: **assumes** A1: `antisym(r)` **and** A2: `HasAmaximum(r,A)`  
**shows**  $\exists! M. M \in A \wedge (\forall x \in A. \langle x, M \rangle \in r)$

**proof**

**from** A2 **show**  $\exists M. M \in A \wedge (\forall x \in A. \langle x, M \rangle \in r)$

**using** `HasAmaximum_def` **by** `auto`

**fix** M1 M2 **assume**

A2:  $M1 \in A \wedge (\forall x \in A. \langle x, M1 \rangle \in r)$   $M2 \in A \wedge (\forall x \in A. \langle x, M2 \rangle \in r)$

**then have**  $\langle M1, M2 \rangle \in r$   $\langle M2, M1 \rangle \in r$  **by** `auto`

**with** A1 **show**  $M1 = M2$  **by** `(rule Fol1_L4)`

**qed**

For antisymmetric relations minimum of a set is unique if it exists.

**lemma** Order\_ZF\_4\_L2: **assumes** A1: `antisym(r)` **and** A2: `HasAminimum(r,A)`  
**shows**  $\exists! m. m \in A \wedge (\forall x \in A. \langle m, x \rangle \in r)$

**proof**

**from** A2 **show**  $\exists m. m \in A \wedge (\forall x \in A. \langle m, x \rangle \in r)$

**using** `HasAminimum_def` **by** `auto`

**fix** m1 m2 **assume**

A2:  $m1 \in A \wedge (\forall x \in A. \langle m1, x \rangle \in r)$   $m2 \in A \wedge (\forall x \in A. \langle m2, x \rangle \in r)$

**then have**  $\langle m1, m2 \rangle \in r$   $\langle m2, m1 \rangle \in r$  **by** `auto`

**with** A1 **show**  $m1 = m2$  **by** `(rule Fol1_L4)`

**qed**

Maximum of a set has desired properties.

**lemma** Order\_ZF\_4\_L3: **assumes** A1: `antisym(r)` **and** A2: `HasAmaximum(r,A)`  
**shows** `Maximum(r,A) ∈ A`  $\forall x \in A. \langle x, \text{Maximum}(r,A) \rangle \in r$

**proof** -

**let** Max = `THE M. M ∈ A ∧ (∀ x ∈ A. ⟨ x, M ⟩ ∈ r)`

**from** A1 A2 **have**  $\exists! M. M \in A \wedge (\forall x \in A. \langle x, M \rangle \in r)$

```

## 7.2 Supremum and Infimum

In this section we consider the notions of supremum and infimum a set.

Elements of the set of upper bounds are indeed upper bounds. Isabelle also thinks it is obvious.

```

lemma Order_ZF_5_L1: assumes  $u \in (\bigcap a \in A. r\{a\})$  and  $a \in A$ 
  shows  $\langle a, u \rangle \in r$ 
  using assms by auto

```

Elements of the set of lower bounds are indeed lower bounds. Isabelle also thinks it is obvious.

```

lemma Order_ZF_5_L2: assumes  $l \in (\bigcap a \in A. r-\{a\})$  and  $a \in A$ 
  shows  $\langle l, a \rangle \in r$ 
  using assms by auto

```

If the set of upper bounds has a minimum, then the supremum is less or equal than any upper bound. We can probably do away with the assumption that  $A$  is not empty, (ab)using the fact that intersection over an empty family is defined in Isabelle to be empty.

```

lemma Order_ZF_5_L3: assumes A1: antisym(r) and A2:  $A \neq 0$  and
  A3: HasAminimum( $r, \bigcap a \in A. r\{a\}$ ) and
  A4:  $\forall a \in A. \langle a, u \rangle \in r$ 
  shows  $\langle \text{Supremum}(r, A), u \rangle \in r$ 
proof -

### 7.3 Strict versions of order relations

One of the problems with translating formalized mathematics from Metamath to IsarMathLib is that Metamath uses strict orders (of the  $<$  type) while in IsarMathLib we mostly use nonstrict orders (of the  $\leq$  type). This doesn't really make any difference, but is annoying as we have to prove many theorems twice. In this section we prove some theorems to make it easier to translate the statements about strict orders to statements about the corresponding non-strict order and vice versa.

We define a strict version of a relation by removing the  $y = x$  line from the relation.

#### definition

$\text{StrictVersion}(r) \equiv r - \{\langle x, x \rangle. x \in \text{domain}(r)\}$

A reformulation of the definition of a strict version of an order.

#### lemma def\_of\_strict\_ver: shows

$\langle x, y \rangle \in \text{StrictVersion}(r) \longleftrightarrow \langle x, y \rangle \in r \wedge x \neq y$   
 using StrictVersion\_def domain\_def by auto

The next lemma is about the strict version of an antisymmetric relation.

#### lemma strict\_of\_antisym:

assumes A1: antisym(r) and A2:  $\langle a, b \rangle \in \text{StrictVersion}(r)$   
 shows  $\langle b, a \rangle \notin \text{StrictVersion}(r)$

#### proof -

```

{ assume A3: ⟨b,a⟩ ∈ StrictVersion(r)
  with A2 have ⟨a,b⟩ ∈ r and ⟨b,a⟩ ∈ r
    using def_of_strict_ver by auto
  with A1 have a=b by (rule Fol1_L4)
  with A2 have False using def_of_strict_ver
    by simp
} then show ⟨b,a⟩ ∉ StrictVersion(r) by auto

```

qed

The strict version of totality.

```

lemma strict_of_tot:
  assumes r {is total on} X and a∈X b∈X a≠b
  shows ⟨a,b⟩ ∈ StrictVersion(r) ∨ ⟨b,a⟩ ∈ StrictVersion(r)
  using assms IsTotal_def def_of_strict_ver by auto

```

A trichotomy law for the strict version of a total and antisymmetric relation. It is kind of interesting that one does not need the full linear order for this.

```

lemma strict_ans_tot_trich:
  assumes A1: antisym(r) and A2: r {is total on} X
  and A3: a∈X b∈X
  and A4: s = StrictVersion(r)
  shows Exactly_1_of_3_holds(⟨a,b⟩ ∈ s, a=b, ⟨b,a⟩ ∈ s)
proof -
  let p = ⟨a,b⟩ ∈ s
  let q = a=b
  let r = ⟨b,a⟩ ∈ s
  from A2 A3 A4 have p ∨ q ∨ r
    using strict_of_tot by auto
  moreover from A1 A4 have p ⟶ ¬q ∧ ¬r
    using def_of_strict_ver strict_of_antisym by simp
  moreover from A4 have q ⟶ ¬p ∧ ¬r
    using def_of_strict_ver by simp
  moreover from A1 A4 have r ⟶ ¬p ∧ ¬q
    using def_of_strict_ver strict_of_antisym by auto
  ultimately show Exactly_1_of_3_holds(p, q, r)
    by (rule Foll_L5)
qed

```

A trichotomy law for linear order. This is a special case of `strict_ans_tot_trich`.

```

corollary strict_lin_trich: assumes A1: IsLinOrder(X,r) and
  A2: a∈X b∈X and
  A3: s = StrictVersion(r)
  shows Exactly_1_of_3_holds(⟨a,b⟩ ∈ s, a=b, ⟨b,a⟩ ∈ s)
  using assms IsLinOrder_def strict_ans_tot_trich by auto

```

For an antisymmetric relation if a pair is in relation then the reversed pair is not in the strict version of the relation.

```

lemma geq_impl_not_less:
  assumes A1: antisym(r) and A2: ⟨a,b⟩ ∈ r
  shows ⟨b,a⟩ ∉ StrictVersion(r)
proof -
  { assume A3: ⟨b,a⟩ ∈ StrictVersion(r)
    with A2 have ⟨a,b⟩ ∈ StrictVersion(r)
      using def_of_strict_ver by auto
    with A1 A3 have False using strict_of_antisym
      by blast
  } then show ⟨b,a⟩ ∉ StrictVersion(r) by auto
qed

```

If an antisymmetric relation is transitive, then the strict version is also transitive, an explicit version `strict_of_transB` below.

```

lemma strict_of_transA:
  assumes A1: trans(r) and A2: antisym(r) and
  A3: s = StrictVersion(r) and A4: ⟨a,b⟩ ∈ s  ⟨b,c⟩ ∈ s
  shows ⟨a,c⟩ ∈ s
proof -
  from A3 A4 have I: ⟨a,b⟩ ∈ r ∧ ⟨b,c⟩ ∈ r
    using def_of_strict_ver by simp
  with A1 have ⟨a,c⟩ ∈ r by (rule Fol1_L3)
  moreover
  { assume a=c
    with I have ⟨a,b⟩ ∈ r and ⟨b,a⟩ ∈ r by auto
    with A2 have a=b by (rule Fol1_L4)
    with A3 A4 have False using def_of_strict_ver by simp
  } then have a≠c by auto
  ultimately have ⟨a,c⟩ ∈ StrictVersion(r)
    using def_of_strict_ver by simp
  with A3 show thesis by simp
qed

```

If an antisymmetric relation is transitive, then the strict version is also transitive.

```

lemma strict_of_transB:
  assumes A1: trans(r) and A2: antisym(r)
  shows trans(StrictVersion(r))
proof -
  let s = StrictVersion(r)
  from A1 A2 have
    ∀ x y z. ⟨x, y⟩ ∈ s ∧ ⟨y, z⟩ ∈ s ⟶ ⟨x, z⟩ ∈ s
    using strict_of_transA by blast
  then show trans(StrictVersion(r)) by (rule Fol1_L2)
qed

```

The next lemma provides a condition that is satisfied by the strict version of a relation if the original relation is a complete linear order.

```

lemma strict_of_compl:
  assumes A1: r ⊆ X×X and A2: IsLinOrder(X,r) and
  A3: r {is complete} and
  A4: A ⊆ X  A ≠ 0 and A5: s = StrictVersion(r) and
  A6: ∃u∈X. ∀y∈A. ⟨y,u⟩ ∈ s
  shows
    ∃x∈X. ( ∀y∈A. ⟨x,y⟩ ∉ s ) ∧ (∀y∈X. ⟨y,x⟩ ∈ s ⟶ (∃z∈A. ⟨y,z⟩ ∈ s))
proof -
  let x = Supremum(r,A)
  from A2 have I: antisym(r) using IsLinOrder_def
    by simp
  moreover from A5 A6 have ∃u∈X. ∀y∈A. ⟨y,u⟩ ∈ r

```

```

    using def_of_strict_ver by auto
  moreover note A1 A3 A4
  ultimately have II:  $x \in X \quad \forall y \in A. \langle y, x \rangle \in r$ 
    using Order_ZF_5_L7 by auto

## 9 func1.thy

**theory func1 imports func Fol1 ZF1**

**begin**

This theory covers basic properties of function spaces. A set of functions with domain  $X$  and values in the set  $Y$  is denoted in Isabelle as  $X \rightarrow Y$ . It just happens that the colon ":" is a synonym of the set membership symbol  $\in$  in Isabelle/ZF so we can write  $f : X \rightarrow Y$  instead of  $f \in X \rightarrow Y$ . This is the only case that we use the colon instead of the regular set membership symbol.

### 9.1 Properties of functions, function spaces and (inverse) images.

Functions in ZF are sets of pairs. This means that if  $f : X \rightarrow Y$  then  $f \subseteq X \times Y$ . This section is mostly about consequences of this understanding of the notion of function.

We define the notion of function that preserves a collection here. Given two collection of sets a function preserves the collections if the inverse image of sets in one collection belongs to the second one. This notion does not have a name in romantic math. It is used to define continuous functions in Topology\_ZF\_2 theory. We define it here so that we can use it for other purposes, like defining measurable functions. Recall that  $f^{-1}(A)$  means the inverse image of the set  $A$ .

**definition**

$\text{PresColl}(f, S, T) \equiv \forall A \in T. f^{-1}(A) \in S$

A definition that allows to get the first factor of the domain of a binary function  $f : X \times Y \rightarrow Z$ .

**definition**

$\text{fstdom}(f) \equiv \text{domain}(\text{domain}(f))$

If a function maps  $A$  into another set, then  $A$  is the domain of the function.

**lemma func1\_1\_L1: assumes  $f:A \rightarrow C$  shows  $\text{domain}(f) = A$**   
**using assms domain\_of\_fun by simp**

Standard Isabelle defines a  $\text{function}(f)$  predicate. the next lemma shows that our function satisfy that predicate. It is a special version of Isabelle's  $\text{fun\_is\_function}$ .

**lemma fun\_is\_fun: assumes  $f:X \rightarrow Y$  shows  $\text{function}(f)$**   
**using assms fun\_is\_function by simp**

A lemma explains what  $\text{fstdom}$  is for.

```

lemma fstdomdef: assumes A1:  $f: X \times Y \rightarrow Z$  and A2:  $Y \neq 0$ 
  shows  $\text{fstdom}(f) = X$ 
proof -
  from A1 have  $\text{domain}(f) = X \times Y$  using func1_1_L1
  by simp
  with A2 show  $\text{fstdom}(f) = X$  unfolding fstdom_def by auto
qed

```

A first-order version of  $\text{Pi\_type}$ .

```

lemma func1_1_L1A: assumes A1:  $f: X \rightarrow Y$  and A2:  $\forall x \in X. f(x) \in Z$ 
  shows  $f: X \rightarrow Z$ 
proof -
  { fix x assume  $x \in X$ 
    with A2 have  $f(x) \in Z$  by simp }
  with A1 show  $f: X \rightarrow Z$  by (rule Pi_type)
qed

```

A variant of  $\text{func1_1\_L1A}$ .

```

lemma func1_1_L1B: assumes A1:  $f: X \rightarrow Y$  and A2:  $Y \subseteq Z$ 
  shows  $f: X \rightarrow Z$ 
proof -
  from A1 A2 have  $\forall x \in X. f(x) \in Z$ 
  using apply_funtype by auto
  with A1 show  $f: X \rightarrow Z$  using func1_1_L1A by blast
qed

```

There is a value for each argument.

```

lemma func1_1_L2: assumes A1:  $f: X \rightarrow Y$   $x \in X$ 
  shows  $\exists y \in Y. \langle x, y \rangle \in f$ 
proof-
  from A1 have  $f(x) \in Y$  using apply_type by simp
  moreover from A1 have  $\langle x, f(x) \rangle \in f$  using apply_Pair by simp
  ultimately show thesis by auto

  using vimage_iff image_iff converse_iff by auto

```

The inverse image by a composition is the composition of inverse images.

```

lemma vimage_comp: shows  $(r \circ s)^{-1}(A) = s^{-1}(r^{-1}(A))$ 
  using vimage_converse converse_comp image_comp image_converse by simp

```

A version of  $\text{vimage\_comp}$  for three functions.

```
lemma vimage_comp3: shows (r 0 s 0 t)-(A) = t-(s-(r-(A)))
  using vimage_comp by simp
```

Inverse image of any set is contained in the domain.

```
lemma func1_1_L3: assumes A1: f:X→Y shows f-(D) ⊆ X
proof-
  have ∀x. x∈f-(D) → x ∈ domain(f)
    using vimage_iff domain_iff by auto
  with A1 have ∀x. (x ∈ f-(D)) → (x∈X) using func1_1_L1 by simp
  then show thesis by auto
qed
```

The inverse image of the range is the domain.

```
lemma func1_1_L4: assumes f:X→Y shows f-(Y) = X
  using assms func1_1_L3 func1_1_L2 vimage_iff by blast
```

The arguments belongs to the domain and values to the range.

```
lemma func1_1_L5:
  assumes A1: ⟨ x,y ⟩ ∈ f and A2: f:X→Y
  shows x∈X ∧ y∈Y
proof
  from A1 A2 show x∈X using apply_iff by simp
  with A2 have f(x)∈ Y using apply_type by simp
  with A1 A2 show y∈Y using apply_iff by simp
qed
```

Function is a subset of cartesian product.

```
lemma fun_subset_prod: assumes A1: f:X→Y shows f ⊆ X×Y
proof
  fix p assume p ∈ f
  with A1 have ∃x∈X. p = ⟨x, f(x)⟩
    using Pi_memberD by simp
  then obtain x where I: p = ⟨x, f(x)⟩
    by auto
  with A1 'p ∈ f' have x∈X ∧ f(x) ∈ Y
    using func1_1_L5 by blast
  with I show p ∈ X×Y by auto
qed
```

The (argument, value) pair belongs to the graph of the function.

```
lemma func1_1_L5A:
  assumes A1: f:X→Y x∈X y = f(x)
  shows ⟨x,y⟩ ∈ f y ∈ range(f)
proof -
  from A1 show ⟨x,y⟩ ∈ f using apply_Pair by simp
  then show y ∈ range(f) using rangeI by simp
qed
```

The next theorem illustrates the meaning of the concept of function in ZF.

```

theorem fun_is_set_of_pairs: assumes A1:  $f:X \rightarrow Y$ 
  shows  $f = \{\langle x, f(x) \rangle. x \in X\}$ 
proof
  from A1 show  $\{\langle x, f(x) \rangle. x \in X\} \subseteq f$  using func1_1_L5A
    by auto
next
  { fix p assume  $p \in f$ 
    with A1 have  $p \in X \times Y$  using fun_subset_prod

## 9.2 Functions restricted to a set

Standard Isabelle/ZF defines the notion `restrict(f,A)` of to mean a function (or relation)  $f$  restricted to a set. This means that if  $f$  is a function defined on  $X$  and  $A$  is a subset of  $X$  then `restrict(f,A)` is a function with the same values as  $f$ , but whose domain is  $A$ .

What is the inverse image of a set under a restricted function?

```

lemma func1_2_L1: assumes A1:  $f:X \rightarrow Y$  and A2:  $B \subseteq X$ 
  shows  $\text{restrict}(f,B)^{-1}(A) = f^{-1}(A) \cap B$ 
proof -
  let  $g = \text{restrict}(f,B)$ 

```

```

from A1 A2 have g:B→Y
  using restrict_type2 by simp

using restrict\_fun comp\_fun by simp  
moreover from A1 have  
 $\forall x \in A. (g \circ f)(x) = (\text{restrict}(g, B) \circ f)(x)$   
using comp\_fun\_apply apply\_funtype restrict  
by simp  
ultimately show  $g \circ f = \text{restrict}(g, B) \circ f$   
by (rule func\_eq)  
qed

A way to look at restriction. Contributed by Victor Porton.

**lemma** right\_comp\_id\_any: shows  $r \circ \text{id}(C) = \text{restrict}(r, C)$   
unfolding restrict\_def by auto

### 9.3 Constant functions

Constant functions are trivial, but still we need to prove some properties to shorten proofs.

We define constant( $= c$ ) functions on a set  $X$  in a natural way as  $\text{ConstantFunction}(X, c)$ .

**definition**

$\text{ConstantFunction}(X, c) \equiv X \times \{c\}$

Constant function belongs to the function space.

**lemma** func1\_3\_L1:  
assumes A1:  $c \in Y$  shows  $\text{ConstantFunction}(X, c) : X \rightarrow Y$   
**proof** -  
from A1 have  $X \times \{c\} = \{\langle x, y \rangle \in X \times Y. c = y\}$

```

      by auto
    with A1 show thesis using func1_1_L11A ConstantFunction_def
      by simp
qed

```

Constant function is equal to the constant on its domain.

```

lemma func1_3_L2: assumes A1:  $x \in X$ 
  shows ConstantFunction( $X, c$ )( $x$ ) =  $c$ 
proof -
  have ConstantFunction( $X, c$ )  $\in X \rightarrow \{c\}$ 
    using func1_3_L1 by simp
  moreover from A1 have  $\langle x, c \rangle \in \text{ConstantFunction}(X, c)$ 
    using ConstantFunction_def by simp
  ultimately show thesis using apply_iff by simp

For a surjection the union of images of singletons is the whole range.

**lemma** `surj_singleton_image`: `assumes A1: f ∈ surj(X,Y)`  
`shows (⋃x∈X. {f(x)}) = Y`

**proof**

`from A1 show (⋃x∈X. {f(x)}) ⊆ Y`  
`using surj_def apply_funtype by auto`

**next**

`{ fix y assume y ∈ Y`  
`with A1 have y ∈ (⋃x∈X. {f(x)})`  
`using surj_def by auto`  
`} then show Y ⊆ (⋃x∈X. {f(x)}) by auto`

qed

## 9.5 Functions of two variables

In this section we consider functions whose domain is a cartesian product of two sets. Such functions are called functions of two variables (although really in ZF all functions admit only one argument). For every function of two variables we can define families of functions of one variable by fixing the other variable. This section establishes basic definitions and results for this concept.

We can create functions of two variables by combining functions of one variable.

**lemma** `cart_prod_fun`: `assumes f1:X1→Y1 f2:X2→Y2 and`  
`g = {⟨p,⟨f1(fst(p)),f2(snd(p))⟩⟩. p ∈ X1×X2}`  
`shows g: X1×X2 → Y1×Y2 using assms apply_funtype ZF_fun_from_total`  
`by simp`

A reformulation of `cart_prod_fun` above in a slightly different notation.

**lemma** `prod_fun`:

`assumes f:X1→X2 g:X3→X4`  
`shows {⟨⟨x,y⟩,⟨fx,gy⟩⟩. ⟨x,y⟩∈X1×X3} : X1×X3→X2×X4`

**proof** -

`have {⟨⟨x,y⟩,⟨fx,gy⟩⟩. ⟨x,y⟩∈X1×X3} = {⟨p,⟨f(fst(p)),g(snd(p))⟩⟩. p ∈ X1×X3}`

`by auto`

`with assms show thesis using cart_prod_fun by simp`

qed

Product of two surjections is a surjection.

**theorem** `prod_functions_surj`:

`assumes f∈surj(A,B) g∈surj(C,D)`

`shows {⟨⟨a1,a2⟩,⟨fa1,ga2⟩⟩. ⟨a1,a2⟩∈A×C} ∈ surj(A×C,B×D)`

**proof** -

```

let h = {⟨⟨x, y⟩, f(x), g(y)⟩ . ⟨x,y⟩ ∈ A × C}
from assms have fun: f:A→Bg:C→D unfolding surj_def by auto
then have pfun: h : A × C → B × D using prod_fun by auto
{
  fix b assume b∈B×D
  then obtain b1 b2 where b=⟨b1,b2⟩ b1∈B b2∈D by auto

    unfolding surj_def by blast
  hence ⟨⟨a1,a2⟩,⟨b1,b2⟩⟩ ∈ h by auto
  with pfun have h⟨a1,a2⟩=⟨b1,b2⟩ using apply_equality by auto
  with 'b=⟨b1,b2⟩' 'a1∈A' 'a2∈C' have ∃a∈A×C. h(a)=b
    by auto
} hence ∀b∈B×D. ∃a∈A×C. h(a) = b by auto
with pfun show thesis unfolding surj_def by auto
qed

```

For a function of two variables created from functions of one variable as in `cart_prod_fun` above, the inverse image of a cartesian product of sets is the cartesian product of inverse images.

```

lemma cart_prod_fun_vimage: assumes f1:X1→Y1 f2:X2→Y2 and
  g = {⟨p,⟨f1(fst(p)),f2(snd(p))⟩⟩. p ∈ X1×X2}
shows g-(A1×A2) = f1-(A1) × f2-(A2)
proof -
  from assms have g: X1×X2 → Y1×Y2 using cart_prod_fun
    by simp
  then have g-(A1×A2) = {p ∈ X1×X2. g(p) ∈ A1×A2} using func1_1_L15

  by simp
  with assms 'g: X1×X2 → Y1×Y2' show g-(A1×A2) = f1-(A1) × f2-(A2)
    using ZF_fun_from_tot_val func1_1_L15 by auto
qed

```

For a function of two variables defined on  $X \times Y$ , if we fix an  $x \in X$  we obtain a function on  $Y$ . Note that if `domain(f)` is  $X \times Y$ , `range(domain(f))` extracts  $Y$  from  $X \times Y$ .

**definition**

$\text{Fix1stVar}(f,x) \equiv \{\langle y, f(x,y) \rangle . y \in \text{range}(\text{domain}(f))\}$

For every  $y \in Y$  we can fix the second variable in a binary function  $f : X \times Y \rightarrow Z$  to get a function on  $X$ .

**definition**

$\text{Fix2ndVar}(f,y) \equiv \{\langle x, f(x,y) \rangle . x \in \text{domain}(\text{domain}(f))\}$

We defined `Fix1stVar` and `Fix2ndVar` so that the domain of the function is not listed in the arguments, but is recovered from the function. The next lemma is a technical fact that makes it easier to use this definition.

```

lemma fix_var_fun_domain: assumes A1: f : X×Y → Z

```

```

shows
x∈X → Fix1stVar(f,x) = {⟨y,f⟨x,y⟩⟩. y ∈ Y}

In this theory we consider properties of functions that are binary operations, that is they map  $X \times X$  into  $X$ .

### 10.1 Lifting operations to a function space

It happens quite often that we have a binary operation on some set and we need a similar operation that is defined for functions on that set. For example once we know how to add real numbers we also know how to add real-valued functions: for  $f, g : X \rightarrow \mathbf{R}$  we define  $(f + g)(x) = f(x) + g(x)$ . Note that formally the  $+$  means something different on the left hand side of this equality than on the right hand side. This section aims at formalizing this process. We will call it "lifting to a function space", if you have a suggestion for a better name, please let me know.

Since we are writing in generic set notation, the definition below is a bit complicated. Here it what it says: Given a set  $X$  and another set  $f$  (that represents a binary function on  $X$ ) we are defining  $f$  lifted to function space over  $X$  as the binary function (a set of pairs) on the space  $F = X \rightarrow \text{range}(f)$  such that the value of this function on pair  $\langle a, b \rangle$  of functions on  $X$  is another function  $c$  on  $X$  with values defined by  $c(x) = f\langle a(x), b(x) \rangle$ .

**definition**

```
Lift2FcnSpce (infix {lifted to function space over} 65) where
  f {lifted to function space over} X  $\equiv$ 
    { $\langle p, \{x, f(\text{fst}(p)(x), \text{snd}(p)(x))\} \rangle$ .  $x \in X$ }.
     $p \in (X \rightarrow \text{range}(f)) \times (X \rightarrow \text{range}(f))$ }
```

The result of the lift belongs to the function space.

**lemma func\_ZF\_1\_L1:**

```
  assumes A1:  $f : Y \times Y \rightarrow Y$ 
  and A2:  $p \in (X \rightarrow \text{range}(f)) \times (X \rightarrow \text{range}(f))$ 
  shows

## 10.2 Associative and commutative operations

In this section we define associative and commutative operations and prove that they remain such when we lift them to a function space.

Typically we say that a binary operation “.” on a set  $G$  is “associative” if  $(x \cdot y) \cdot z = x \cdot (y \cdot z)$  for all  $x, y, z \in G$ . Our actual definition below does not use the multiplicative notation so that we can apply it equally to the additive notation  $+$  or whatever infix symbol we may want to use. Instead, we use the generic set theory notation and write  $P\langle x, y \rangle$  to denote the value of the operation  $P$  on a pair  $\langle x, y \rangle \in G \times G$ .

### definition

```

IsAssociative (infix {is associative on} 65) where
P {is associative on} G ≡ P : G×G→G ∧
(∀ x ∈ G. ∀ y ∈ G. ∀ z ∈ G.
( P(⟨P(⟨x,y⟩),z⟩) = P(⟨x,P(⟨y,z⟩)⟩) ))

```

A binary function  $f : X \times X \rightarrow Y$  is commutative if  $f\langle x, y \rangle = f\langle y, x \rangle$ . Note that in the definition of associativity above we talk about binary “operation” and here we say use the term binary “function”. This is not set in stone, but usually the word “operation” is used when the range is a factor of the domain, while the word “function” allows the range to be a completely unrelated set.

### definition

```

IsCommutative (infix {is commutative on} 65) where
f {is commutative on} G ≡ ∀x∈G. ∀y∈G. f⟨x,y⟩ = f⟨y,x⟩

```

The lift of a commutative function is commutative.

  using assms IsOpClosed_def by simp

```

## 10.4 Compositions

For any set  $X$  we can consider a binary operation on the set of functions  $f : X \rightarrow X$  defined by  $C(f, g) = f \circ g$ . Composition of functions (or relations) is defined in the standard Isabelle distribution as a higher order function and denoted with the letter  $\circ$ . In this section we consider the corresponding two-argument ZF-function (binary operation), that is a subset of  $((X \rightarrow X) \times (X \rightarrow X)) \times (X \rightarrow X)$ .

We define the notion of composition on the set  $X$  as the binary operation on the function space  $X \rightarrow X$  that takes two functions and creates the their composition.

**definition**

```
Composition(X)  $\equiv$ 
  {⟨p, fst(p)  $\circ$  snd(p)⟩. p  $\in$  (X $\rightarrow$ X) $\times$ (X $\rightarrow$ X)}
```

Composition operation is a function that maps  $(X \rightarrow X) \times (X \rightarrow X)$  into  $X \rightarrow X$ .

## 10.6 Lifting to subsets

Suppose we have a binary operation  $f : X \times X \rightarrow X$  written additively as  $f\langle x, y \rangle = x + y$ . Such operation naturally defines another binary operation on the subsets of  $X$  that satisfies  $A + B = \{x + y : x \in A, y \in B\}$ . This new operation which we will call " $f$  lifted to subsets" inherits many properties of  $f$ , such as associativity, commutativity and existence of the neutral element. This notion is useful for considering interval arithmetics.

The next definition describes the notion of a binary operation lifted to subsets. It is written in a way that might be a bit unexpected, but really it is the same as the intuitive definition, but shorter. In the definition we take a pair  $p \in \text{Pow}(X) \times \text{Pow}(X)$ , say  $p = \langle A, B \rangle$ , where  $A, B \subseteq X$ . Then we assign this pair of sets the set  $\{f\langle x, y \rangle : x \in A, y \in B\} = \{f(x') : x' \in A \times B\}$ . The set on the right hand side is the same as the image of  $A \times B$  under  $f$ . In the definition we don't use  $A$  and  $B$  symbols, but write  $\text{fst}(p)$  and  $\text{snd}(p)$ , resp. Recall that in Isabelle/ZF  $\text{fst}(p)$  and  $\text{snd}(p)$  denote the first and second components of an ordered pair  $p$ . See the lemma `lift_subsets_explained` for a more intuitive notation.

## 10.7 Distributive operations

In this section we deal with pairs of operations such that one is distributive with respect to the other, that is  $a \cdot (b + c) = a \cdot b + a \cdot c$  and  $(b + c) \cdot a = b \cdot a + c \cdot a$ . We show that this property is preserved under restriction to a set closed with respect to both operations. In `EquivClass1` theory we show that this property is preserved by projections to the quotient space if both operations are congruent with respect to the equivalence relation.

We define distributivity as a statement about three sets. The first set is the set on which the operations act. The second set is the additive operation (a ZF function) and the third is the multiplicative operation.

**definition**

```
IsDistributive(X,A,M) ≡ (∀ a∈X.∀ b∈X.∀ c∈X.
  M⟨a,A⟨b,c⟩⟩ = A⟨M⟨a,b⟩,M⟨a,c⟩⟩ ∧
  M⟨A⟨b,c⟩,a⟩ = A⟨M⟨b,a⟩,M⟨c,a⟩⟩)
```

The essential condition to show that distributivity is preserved by restrictions to sets that are closed with respect to both operations.

**lemma** `func_ZF_7_L1`:

```
  assumes A1: IsDistributive(X,A,M)
  and A2: Y⊆X
  and A3: Y {is closed under} A  Y {is closed under} M
  and A4: Ar = restrict(A,Y×Y) Mr = restrict(M,Y×Y)
  and A5: a∈Y  b∈Y  c∈Y
  shows Mr⟨ a,Ar⟨b,c⟩ ⟩ = Ar⟨ Mr⟨a,b⟩,Mr⟨a,c⟩ ⟩ ∧
  Mr⟨ Ar⟨b,c⟩,a ⟩ = Ar⟨ Mr⟨b,a⟩, Mr⟨c,a⟩ ⟩
proof -

## 11 func\_ZF\_1.thy

**theory** func\_ZF\_1 **imports** Order Order\_ZF\_1a func\_ZF

**begin**

In this theory we consider some properties of functions related to order relations

### 11.1 Functions and order

This section deals with functions between ordered sets.

If every value of a function on a set is bounded below by a constant, then the image of the set is bounded below.

**lemma** func\_ZF\_8\_L1:  
  **assumes**  $f:X \rightarrow Y$  **and**  $A \subseteq X$  **and**  $\forall x \in A. \langle L, f(x) \rangle \in r$   
  **shows**  $\text{IsBoundedBelow}(f(A), r)$   
**proof** -  
  **from** **assms** **have**  $\forall y \in f(A). \langle L, y \rangle \in r$   
    **using** func\_imagedef **by** simp  
  **then show**  $\text{IsBoundedBelow}(f(A), r)$   
    **by** (rule Order\_ZF\_3\_L9)  
**qed**

If every value of a function on a set is bounded above by a constant, then the image of the set is bounded above.

**lemma** func\_ZF\_8\_L2:  
  **assumes**  $f:X \rightarrow Y$  **and**  $A \subseteq X$  **and**  $\forall x \in A. \langle f(x), U \rangle \in r$   
  **shows**  $\text{IsBoundedAbove}(f(A), r)$   
**proof** -  
  **from** **assms** **have**  $\forall y \in f(A). \langle y, U \rangle \in r$   
    **using** func\_imagedef **by** simp  
  **then show**  $\text{IsBoundedAbove}(f(A), r)$   
    **by** (rule Order\_ZF\_3\_L10)  
**qed**

Identity is an order isomorphism.

**lemma** id\_ord\_iso: **shows**  $\text{id}(X) \in \text{ord\_iso}(X, r, X, r)$   
  **using** id\_bij id\_def ord\_iso\_def **by** simp

Identity is the only order automorphism of a singleton.

**lemma** id\_ord\_auto\_singleton:  
  **shows**  $\text{ord\_iso}(\{x\}, r, \{x\}, r) = \{\text{id}(\{x\})\}$   
  **using** id\_ord\_iso ord\_iso\_def single\_bij\_id  
  **by** auto

The image of a maximum by an order isomorphism is a maximum. Note that from the fact the  $r$  is antisymmetric and  $f$  is an order isomorphism

between  $(A, r)$  and  $(B, R)$  we can not conclude that  $R$  is antisymmetric (we can only show that  $R \cap (B \times B)$  is).

```

## 11.2 Projections in cartesian products

In this section we consider maps arising naturally in cartesian products.

There is a natural bijection between  $X = Y \times \{y\}$  (a "slice") and  $Y$ . We will call this the `SliceProjection`( $Y \times \{y\}$ ). This is really the ZF equivalent of the meta-function `fst(x)`.

**definition**

$\text{SliceProjection}(X) \equiv \{\langle p, \text{fst}(p) \rangle. p \in X\}$

A slice projection is a bijection between  $X \times \{y\}$  and  $X$ .

**lemma slice\_proj\_bij: shows**

$\text{SliceProjection}(X \times \{y\}): X \times \{y\} \rightarrow X$   
 $\text{domain}(\text{SliceProjection}(X \times \{y\})) = X \times \{y\}$   
 $\forall p \in X \times \{y\}. \text{SliceProjection}(X \times \{y\})(p) = \text{fst}(p)$   
 $\text{SliceProjection}(X \times \{y\}) \in \text{bij}(X \times \{y\}, X)$

**proof -**

let P =  $\text{SliceProjection}(X \times \{y\})$   
 have  $\forall p \in X \times \{y\}. \text{fst}(p) \in X$  by simp  
 moreover from this have  
 $\{\langle p, \text{fst}(p) \rangle. p \in X \times \{y\}\} : X \times \{y\} \rightarrow X$   
 by (rule ZF\_fun\_from\_total)  
 ultimately show

```

### 11.3 Induced relations and order isomorphisms

When we have two sets  $X, Y$ , function  $f : X \rightarrow Y$  and a relation  $R$  on  $Y$  we can define a relation  $r$  on  $X$  by saying that  $x r y$  if and only if  $f(x) R f(y)$ . This is especially interesting when  $f$  is a bijection as all reasonable properties of  $R$  are inherited by  $r$ . This section treats mostly the case when  $R$  is an order relation and  $f$  is a bijection. The standard Isabelle's `Order` theory defines the notion of a space of order isomorphisms between two sets relative to a relation. We expand that material proving that order isomorphisms preserve interesting properties of the relation.

We call the relation created by a relation on  $Y$  and a mapping  $f : X \rightarrow Y$  the `InducedRelation(f,R)`.

**definition**

```

InducedRelation(f,R) ≡
  {p ∈ domain(f)×domain(f). ⟨f(fst(p)),f(snd(p))⟩ ∈ R}

```

A reformulation of the definition of the relation induced by a function.

```

lemma def_of_ind_relA:
  assumes ⟨x,y⟩ ∈ InducedRelation(f,R)
  shows ⟨f(x),f(y)⟩ ∈ R
  using assms InducedRelation_def by simp

```

A reformulation of the definition of the relation induced by a function, kind of converse of `def_of_ind_relA`.

```

lemma def_of_ind_relB: assumes f:A→B and
  x∈A y∈A and ⟨f(x),f(y)⟩ ∈ R
  shows ⟨x,y⟩ ∈ InducedRelation(f,R)
  using assms func1_1_L1 InducedRelation_def by simp

```

A property of order isomorphisms that is missing from standard Isabelle's `Order.thy`.

```
lemma ord_iso_apply_conv:
  assumes f ∈ ord_iso(A,r,B,R) and
  ⟨f(x),f(y)⟩ ∈ R and x∈A y∈A
  shows ⟨x,y⟩ ∈ r
  using assms ord_iso_def by simp
```

The next lemma tells us where the induced relation is defined

**begin**

This theory formalizes the intuitive notion of *generalization*.

See <http://www.mathematics21.org/generalization.html> for more details.

Contributed by Victor Porton.

### 12.1 Generalization situation

In mathematics it is often encountered that a small set  $S$  naturally bijectively corresponds to a subset  $R$  of a larger set  $B$ . (In other words, there is specified an injection  $E$  from  $S$  to  $B$ .) It is a widespread practice to equate  $S$  with  $R$ . But strictly speaking this equating may contradict to the axioms of ZF/ZFC because we are not insured against  $S \cap B \neq \emptyset$  incidents. To work around of this (and formulate things exactly what could benefit computer proof assistants) we will replace the set  $B$  with a new set  $B$  having a bijection  $M : B \rightarrow B$  such that  $M \circ E = id_S$ . (I call this bijection  $M$  from the first letter of the word "move" which signifies the move from the old set  $B$  to a new set  $B$ . This section contains some basic lemmas holding in this setup.

The next locale defines our assumptions.

```
locale generalization =  
  fixes small and big  
  fixes embed  
  assumes embed_inj: embed  $\in$  inj(small, big)
```

We define the small2 set as the range of embed.

```
definition (in generalization) small2  $\equiv$  range(embed)
```

We define spec as the converse of embed.

```
definition (in generalization) spec  $\equiv$  converse(embed)
```

Spec is an injection from range of embed to small.

```
lemma (in generalization) spec_inj: shows spec  $\in$  inj(small2, small)  
  using embed_inj inj_converse_inj small2_def spec_def by simp
```

Spec maps range of embed to small.

```
lemma (in generalization) spec_fun: shows spec: small2 $\rightarrow$ small  
  using embed_inj inj_converse_fun small2_def spec_def by simp
```

Embed maps smallsmall to big.

```
lemma (in generalization) embed_fun: shows embed: small $\rightarrow$ big  
  using embed_inj inj_is_fun by simp
```

Embed is a surjection from `small` to `small2`.

```
lemma (in generalization) embed_surj: shows embed ∈ surj(small, small2)
  using fun_is_surj embed_fun small2_def by simp
```

Embed is a bijection between `small` and `small2`.

```
theorem (in generalization) embed_bij: shows embed ∈ bij(small, small2)
  using embed_inj inj_bij_range small2_def by simp
```

`small2` (i.e. range of `embed`) is a subset of `big`.

```
theorem (in generalization) small2_sub_big: shows small2 ⊆ big
  using embed_fun func1_1_L5B small2_def by simp
```

`spec` is a bijection between `small2` and `small`.

```
theorem (in generalization) spec_bij: shows spec ∈ bij(small2, small)
  using bij_converse_bij embed_bij spec_def by simp
```

## 12.2 Arbitrary generalizations

This section considers a more general situation.

The next locale extends `generalization` adding another `big` set and the `move` operation.

```
locale generalization1 = generalization +
  fixes newbig
  fixes move
  assumes move_bij: move ∈ bij(big, newbig)
  assumes move_embed: move 0 embed = id(small)
```

in `generalization1` context we define `ret` as the converse of `move`.

```
definition (in generalization1) ret ≡ converse(move)
```

`move` is a map from `big` to `newbig`.

```
lemma (in generalization1) move_fun: shows move: big → newbig
  using move_bij bij_is_fun by simp
```

`move` is an injection from `big` to `newbig`.

```
lemma (in generalization1) move_inj: shows move ∈ inj(big, newbig)
  using move_bij bij_is_inj by simp
```

`Move` is a surjection `big` to `newbig`.

```
lemma (in generalization1) move_surj: shows move ∈ surj(big, newbig)
  using move_bij bij_is_surj by simp
```

`big` is the domain of `move`.

```
lemma (in generalization1) move_domain: shows domain(move) = big
  using domain_of_fun move_fun by simp
```

Composing move with embed takes elements of small to themselves.

**theorem** (in generalization1) move\_embed\_plain: assumes  $x \in \text{small}$   
 shows  $\text{move}(\text{embed}(x)) = x$

**proof** -

### 12.3 ZF generalization

We continue material from the previous section.

We will need this lemma to assert that ZF generalization is an arbitrary generalization:

**lemma** mem\_not\_refl\_2: shows  $\{t\} \notin t$   
 using foundation by auto

Definition of token.

**definition** (in generalization) token  $\equiv \text{Pow}(\bigcup(\bigcup(\text{small})))$

Definition of function moving the small set into big.

**definition** (in generalization)

$\text{zf\_move\_fun}(x) \equiv \text{if } x \in \text{small2} \text{ then } \text{spec}(x) \text{ else } \langle \text{token}, x \rangle$

Definition of  $\text{zf\_move}$  - the ZF version of  $\text{zf\_move\_fun}$ .

**definition** (in generalization)

$\text{zf\_move} \equiv \{ \langle x, \text{zf\_move\_fun}(x) \rangle \mid x \in \text{big} \}$

Definition of  $\text{zf\_newbig}$  as the range of  $\text{zf\_move}$ .

**definition** (in generalization)  $\text{zf\_newbig} \equiv \text{range}(\text{zf\_move})$

$\text{zf\_move}$  is a function that maps big to newbig.

**lemma** (in generalization)  $\text{zf\_move\_fun}$ : shows  $\text{zf\_move}: \text{big} \rightarrow \text{zf\_newbig}$   
 using  $\text{lam\_is\_fun\_range}$   $\text{zf\_move\_def}$   $\text{zf\_newbig\_def}$  by simp

token is not in small.

**lemma** (in generalization)  $\text{token\_not\_small}$ : shows  $\langle \text{token}, x \rangle \notin \text{small}$

**proof**

assume  $\langle \text{token}, x \rangle \in \text{small}$

then have  $\{\text{token}\} \in \text{token}$  using  $\text{token\_def}$   $\text{Pair\_def}$  by auto

then show False using  $\text{mem\_not\_refl\_2}$  by blast

## 13 NatGenIntEx\_ZF.thy

```
theory NatGenIntEx_ZF imports Int_ZF Generalization_ZF
```

```
begin
```

This theory shows an example application of the setup for generalization presented in `Generalization_ZF`.

In this example I show that integers can be considered as a generalization of natural numbers. The next interpretation shows that we can use theorems proven in the `generalization` locale to sets `nat`, `int` and the natural embedding of natural numbers into integers.

```
interpretation int_interpr:
  generalization nat int {⟨n,int_of(n)⟩. n ∈ nat}
proof -
  let f = {⟨n,int_of(n)⟩. n ∈ nat}
  have f ∈ inj(nat,int)
  proof -
    have I: f: nat → int using ZF_fun_from_total by simp
    moreover from I have ∀n∈nat. f(n)= int_of(n)
      using ZF_fun_from_tot_val by simp
    moreover have ∀n∈nat.∀m∈nat. int_of(n)=int_of(m) ⟶ n=m
      using int_of_inject by simp
    ultimately show thesis using inj_def by simp
  qed
  then show generalization(nat,int,f) using generalization_def by simp
qed
```

Next we prove that ZF generalization is an arbitrary generalization. This allows to access notions defined in `generalization1` locale from within `generalization` locale.

```
sublocale
  generalization ⊆ generalization1 small big embed zf_newbig zf_move

```

An example of defining an operation on the generalization set.

```
definition add where
  add(x,y) ≡ int_interpr.zf_move(int_interpr.retx $+ int_interpr.rety)
end
```

## 14 Finite\_ZF.thy

```
theory Finite_ZF imports ZF1 Nat_ZF_IML Cardinal
```

```
begin
```

Standard Isabelle Finite.thy contains a very useful notion of finite powerset: the set of finite subsets of a given set. The definition, however, is specific to Isabelle and based on the notion of "datatype", obviously not something that belongs to ZF set theory. This theory file develops the notion of finite powerset similarly as in Finite.thy, but based on standard library's Cardinal.thy. This theory file is intended to replace IsarMathLib's `Finite1` and `Finite_ZF_1` theories that are currently derived from the "datatype" approach.

### 14.1 Definition and basic properties of finite powerset

The goal of this section is to prove an induction theorem about finite powersets: if the empty set has some property and this property is preserved by adding a single element of a set, then this property is true for all finite subsets of this set.

We defined the finite powerset `FinPow(X)` as those elements of the powerset that are finite.

**definition**

```
FinPow(X)  $\equiv$  {A  $\in$  Pow(X). Finite(A)}
```

The cardinality of an element of finite powerset is a natural number.

```
lemma card_fin_is_nat: assumes A  $\in$  FinPow(X)
  shows |A|  $\in$  nat and A  $\approx$  |A|
  using assms FinPow_def Finite_def cardinal_cong nat_into_Card
    Card_cardinal_eq by auto
```

A reformulation of `card_fin_is_nat`: for a finite set  $A$  there is a bijection between  $|A|$  and  $A$ .

```
lemma fin_bij_card: assumes A1: A  $\in$  FinPow(X)
  shows  $\exists b. b \in \text{bij}(|A|, A)$ 
proof -
  from A1 have |A|  $\approx$  A using card_fin_is_nat eqpoll_sym
    by blast
  then show thesis using eqpoll_def by auto
qed
```

If a set has the same number of elements as  $n \in \mathbb{N}$ , then its cardinality is  $n$ . Recall that in set theory a natural number  $n$  is a set that has  $n$  elements.

```
lemma card_card: assumes A  $\approx$  n and n  $\in$  nat
```

```

shows |A| = n
using assms cardinal_cong nat_into_Card Card_cardinal_eq
by auto

```

If we add a point to a finite set, the cardinality increases by one. To understand the second assertion  $|A \cup \{a\}| = |A| \cup \{|A|\}$  recall that the cardinality  $|A|$  of  $A$  is a natural number and for natural numbers we have  $n+1 = n \cup \{n\}$ .

```

lemma card_fin_add_one: assumes A1: A ∈ FinPow(X) and A2: a ∈ X-A
shows
  |A ∪ {a}| = succ( |A| )
  |A ∪ {a}| = |A| ∪ {|A|}
proof -

## 15 Finite1.thy

**theory** Finite1 **imports** Finite func1 ZF1

**begin**

This theory extends Isabelle standard **Finite** theory. It is obsolete and should not be used for new development. Use the **Finite\_ZF** instead.

### 15.1 Finite powerset

In this section we consider various properties of **Fin** datatype (even though there are no datatypes in ZF set theory).

In **Topology\_ZF** theory we consider induced topology that is obtained by taking a subset of a topological space. To show that a topology restricted to a subset is also a topology on that subset we may need a fact that if  $T$  is a collection of sets and  $A$  is a set then every finite collection  $\{V_i\}$  is of the form  $V_i = U_i \cap A$ , where  $\{U_i\}$  is a finite subcollection of  $T$ . This is one of those trivial facts that require suprisingly long formal proof. Actually, the need for this fact is avoided by requiring intersection two open sets to be open (rather than intersection of a finite number of open sets). Still, the fact is left here as an example of a proof by induction. We will use **Fin\_induct** lemma from **Finite.thy**. First we define a property of finite sets that we want to show.

**definition**

$\text{Prfin}(T, A, M) \equiv (M = 0) \mid (\exists N \in \text{Fin}(T). \forall V \in M. \exists U \in N. (V = U \cap A))$

Now we show the main induction step in a separate lemma. This will make the proof of the theorem **FinRestr** below look short and nice. The premises of the **ind\_step** lemma are those needed by the main induction step in lemma **Fin\_induct** (see standard Isabelle's **Finite.thy**).

**lemma** **ind\_step**: **assumes**  $A: \forall V \in T. A. \exists U \in T. V = U \cap A$

**and**  $A1: W \in T$  **and**  $A2: M \in \text{Fin}(T)$

**and**  $A3: W \notin M$  **and**  $A4: \text{Prfin}(T, A, M)$

**shows**  $\text{Prfin}(T, A, \text{cons}(W, M))$

**proof** -

{ **assume**  $A7: M = 0$  **have**  $\text{Prfin}(T, A, \text{cons}(W, M))$

**proof**-

**from**  $A1$   $A$  **obtain**  $U$  **where**  $A5: U \in T$  **and**  $A6: W = U \cap A$  **by** **fast**

**let**  $N = \{U\}$

**from**  $A5$  **have**  $T1: N \in \text{Fin}(T)$  **by** **simp**

**from**  $A7$   $A6$  **have**  $T2: \forall V \in \text{cons}(W, M). \exists U \in N. V = U \cap A$  **by** **simp**

**from**  $A7$   $T1$   $T2$  **show**  $\text{Prfin}(T, A, \text{cons}(W, M))$

**using** **Prfin\_def** **by** **auto**

**qed** }

**moreover**

```

{ assume A8:M≠0 have Prfin(T, A, cons(W, M))
  proof-
    from A1 A obtain U where A5: U∈T and A6:W=U∩A by fast
    from A8 A4 obtain N0
  where A9: N0∈ Fin(T) and A10: ∀V∈ M. ∃ U0∈ N0. (V = U0∩A)
  using Prfin_def by auto
    let N = cons(U,N0)
    from A5 A9 have N ∈ Fin(T) by simp
    moreover from A10 A6 have ∀V∈ cons(W,M). ∃ U∈N. V=U∩A by simp
    ultimately have ∃ N∈ Fin(T).∀V∈ cons(W,M). ∃ U∈N. V=U∩A by auto
    with A8 show Prfin(T, A, cons(W, M))
  using Prfin_def by simp
  qed }
  ultimately show thesis by auto
qed

```

Now we are ready to prove the statement we need.

```

theorem FinRestr0: assumes A: ∀ V ∈ TA. ∃ U∈ T. V=U∩A
  shows ∀ M∈ Fin(TA). Prfin(T,A,M)
proof -

proof -
  have  $\bigcup \text{cons}(A, N) = A \cup \bigcup N$  by blast
  with A1 A2 A5 show thesis by simp
qed

```

The lemma: a collection closed with respect to taking a union of two sets is closed under taking finite unions.

```

lemma Finite1_L3:
  assumes A1:  $0 \in C$  and A2:  $\forall A B. ((A \in C \wedge B \in C) \longrightarrow A \cup B \in C)$  and
  A3:  $N \in \text{Fin}(C)$ 
  shows  $\bigcup N \in C$ 
proof -
  note A3
  moreover from A1 have  $\bigcup 0 \in C$  by simp
  moreover
  { fix A N
    assume A4:  $A \in C$  A5:  $N \in \text{Fin}(C)$  A6:  $A \notin N$  A7:  $\bigcup N \in C$ 
    with A2 have A8:  $\bigcup \text{cons}(A, N) \in C$  by (rule Finite1_L3_IndStep) }
  ultimately show  $\bigcup N \in C$  by (rule Fin_induct)
qed

```

A collection closed with respect to taking a intersection of two sets is closed under taking finite intersections. Proof by induction with the induction step formulated in a separate lemma. This is slightly more involved than the union case in Finite1\_L3, because the intersection of empty collection is undefined (or should be treated as such). To simplify notation we define the property to be proven for finite sets as a separate notion.

**definition**

$$\text{IntPr}(T, N) \equiv (N = 0 \mid \bigcap N \in T)$$

The induction step.

```

lemma Finite1_L4_IndStep:
  assumes A1:  $\forall A B. ((A \in T \wedge B \in T) \longrightarrow A \cap B \in T)$ 
  and A2:  $A \in T$  and A3:  $N \in \text{Fin}(T)$  and A4:  $A \notin N$  and A5:  $\text{IntPr}(T, N)$ 

```

```

    shows IntPr(T, cons(A, N))
  proof -
    { assume A6: N=0
      with A2 have IntPr(T, cons(A, N))
        using IntPr_def by simp }
    moreover
    { assume A7: N≠0 have IntPr(T, cons(A, N))
      proof -
        from A7 A5 A2 A1 have  $\bigcap N \cap A \in T$  using IntPr_def by simp
        moreover from A7 have  $\bigcap \text{cons}(A, N) = \bigcap N \cap A$  by auto
        ultimately show IntPr(T, cons(A, N)) using IntPr_def by simp
      qed }
    ultimately show thesis by auto
  qed

```

The lemma.

```

lemma Finite1_L4:
  assumes A1:  $\forall A B. A \in T \wedge B \in T \longrightarrow A \cap B \in T$ 
  and A2:  $N \in \text{Fin}(T)$ 
  shows IntPr(T, N)
proof -
  note A2
  moreover have IntPr(T, 0) using IntPr_def by simp
  moreover
  { fix A N
    assume A∈T N∈Fin(T) A∉N IntPr(T, N)
    with A1 have IntPr(T, cons(A, N)) by (rule Finite1_L4_IndStep) }
  ultimately show IntPr(T, N) by (rule Fin_induct)
qed

```

Next is a restatement of the above lemma that does not depend on the IntPr meta-function.

```

lemma Finite1_L5:
  assumes A1:  $\forall A B. ((A \in T \wedge B \in T) \longrightarrow A \cap B \in T)$ 
  and A2:  $N \neq 0$  and A3:  $N \in \text{Fin}(T)$ 
  shows  $\bigcap N \in T$ 
proof -
  from A1 A3 have IntPr(T, N) using Finite1_L4 by simp
  with A2 show thesis using IntPr_def by simp
qed

```

The images of finite subsets by a meta-function are finite. For example in topology if we have a finite collection of sets, then closing each of them results in a finite collection of closed sets. This is a very useful lemma with many unexpected applications. The proof is by induction. The next lemma is the induction step.

```

lemma fin_image_fin_IndStep:
  assumes  $\forall V \in B. K(V) \in C$ 

```

and  $U \in B$  and  $N \in \text{Fin}(B)$  and  $U \notin N$  and  $\{K(V). V \in N\} \in \text{Fin}(C)$

## 17 FinOrd\_ZF.thy

**theory** FinOrd\_ZF **imports** Finite\_ZF func\_ZF\_1

**begin**

This theory file contains properties of finite sets related to order relations. Part of this is similar to what is done in `Finite_ZF_1` except that the development is based on the notion of finite powerset defined in `Finite_ZF` rather than the one defined in standard Isabelle `Finite` theory.

### 17.1 Finite vs. bounded sets

The goal of this section is to show that finite sets are bounded and have maxima and minima.

For total and transitive relations nonempty finite set has a maximum.

**theorem** fin\_has\_max:

**assumes** A1:  $r$  {is total on}  $X$  **and** A2:  $\text{trans}(r)$

**and** A3:  $B \in \text{FinPow}(X)$  **and** A4:  $B \neq 0$

**shows**  $\text{HasAmaximum}(r, B)$

**proof** -

**have**  $0=0 \vee \text{HasAmaximum}(r, 0)$  **by** simp

**moreover** **have**

$\forall A \in \text{FinPow}(X). A=0 \vee \text{HasAmaximum}(r, A) \longrightarrow$   
 $(\forall x \in X. (A \cup \{x\}) = 0 \vee \text{HasAmaximum}(r, A \cup \{x\}))$

**proof** -

{ **fix**  $A$

**assume**  $A \in \text{FinPow}(X)$   $A = 0 \vee \text{HasAmaximum}(r, A)$

**have**  $\forall x \in X. (A \cup \{x\}) = 0 \vee \text{HasAmaximum}(r, A \cup \{x\})$

**proof** -

{ **fix**  $x$  **assume**  $x \in X$

**note** ' $A = 0 \vee \text{HasAmaximum}(r, A)$ '

**moreover**

{ **assume**  $A = 0$

**then** **have**  $A \cup \{x\} = \{x\}$  **by** simp

**from** A1 **have**  $\text{refl}(X, r)$  **using** total\_is\_refl

**by** simp

**with** ' $x \in X$ ' ' $A \cup \{x\} = \{x\}$ ' **have**  $\text{HasAmaximum}(r, A \cup \{x\})$

**using** Order\_ZF\_4\_L8 **by** simp }

**moreover**

{ **assume**  $\text{HasAmaximum}(r, A)$

**with** A1 A2 ' $A \in \text{FinPow}(X)$ ' ' $x \in X$ '

**have**  $\text{HasAmaximum}(r, A \cup \{x\})$

**using** FinPow\_def Order\_ZF\_4\_L9 **by** simp }

**ultimately** **have**  $A \cup \{x\} = 0 \vee \text{HasAmaximum}(r, A \cup \{x\})$

**by** auto

} **thus**  $\forall x \in X. (A \cup \{x\}) = 0 \vee \text{HasAmaximum}(r, A \cup \{x\})$

```

    by simp
    qed
  } thus thesis by simp
qed
moreover note A3
ultimately have B = 0  $\vee$  HasAmaximum(r,B)
  by (rule FinPow_induct)
with A4 show HasAmaximum(r,B) by simp
qed

```

For linearly ordered nonempty finite sets the maximum is in the set and indeed it is the greatest element of the set.

```

    by auto
  with A2 show Maximum(r,A)  $\in$  X using FinPow_def
    by auto
qed

```

## 17.2 Order isomorphisms of finite sets

In this section we establish that if two linearly ordered finite sets have the same number of elements, then they are order-isomorphic and the isomorphism is unique. This allows us to talk about "enumeration" of a linearly ordered finite set. We define the enumeration as the order isomorphism between the number of elements of the set (which is a natural number  $n = \{0, 1, \dots, n-1\}$ ) and the set.

A really weird corner case - empty set is order isomorphic with itself.

```

lemma empty_ord_iso: shows ord_iso(0,r,0,R)  $\neq$  0
proof -

```

An induction (or maybe recursion?) scheme for linearly ordered sets. The induction step is that we show that if the property holds when the set is a singleton or for a set with the maximum removed, then it holds for the set. The idea is that since we can build any finite set by adding elements on the right, then if the property holds for the empty set and is invariant with respect to this operation, then it must hold for all finite sets.

```

## 18 EquivClass1.thy

**theory** EquivClass1 **imports** EquivClass func\_ZF ZF1

**begin**

In this theory file we extend the work on equivalence relations done in the standard Isabelle's EquivClass theory. That development is very good and all, but we really would prefer an approach contained within the a standard ZF set theory, without extensions specific to Isabelle. That is why this theory is written.

### 18.1 Congruent functions and projections on the quotient

Suppose we have a set  $X$  with a relation  $r \subseteq X \times X$  and a function  $f : X \rightarrow X$ . The function  $f$  can be compatible (congruent) with  $r$  in the sense that if two elements  $x, y$  are related then the values  $f(x), f(y)$  are also related. This is especially useful if  $r$  is an equivalence relation as it allows to "project" the function to the quotient space  $X/r$  (the set of equivalence classes of  $r$ ) and create a new function  $F$  that satisfies the formula  $F([x]_r) = [f(x)]_r$ . When  $f$  is congruent with respect to  $r$  such definition of the value of  $F$  on the equivalence class  $[x]_r$  does not depend on which  $x$  we choose to represent the class. In this section we also consider binary operations that are congruent with respect to a relation. These are important in algebra - the congruency condition allows to project the operation to obtain the operation on the quotient space.

First we define the notion of function that maps equivalent elements to equivalent values. We use similar names as in the Isabelle's standard EquivClass theory to indicate the conceptual correspondence of the notions.

**definition**

$$\text{Congruent}(r, f) \equiv (\forall x \ y. \langle x, y \rangle \in r \longrightarrow \langle f(x), f(y) \rangle \in r)$$

Now we will define the projection of a function onto the quotient space. In standard math the equivalence class of  $x$  with respect to relation  $r$  is usually denoted  $[x]_r$ . Here we reuse notation  $r\{x\}$  instead. This means the image of the set  $\{x\}$  with respect to the relation, which, for equivalence relations is exactly its equivalence class if you think about it.

**definition**

$$\text{ProjFun}(A, r, f) \equiv \{\langle c, \bigcup_{x \in c} r\{f(x)\} \rangle. \ c \in (A//r)\}$$

Elements of equivalence classes belong to the set.

**lemma** EquivClass\_1\_L1:

**assumes** A1: equiv(A, r) **and** A2:  $C \in A//r$  **and** A3:  $x \in C$

```

Congruent functions can be projected.

```

lemma EquivClass_1_T0:
  assumes equiv(A,r) Congruent(r,f)
  shows ProjFun(A,r,f) : A//r  $\rightarrow$  A//r
  using assms EquivClass_1_L6 ProjFun_def ZF_fun_from_total
  by simp

```

We now define congruent functions of two variables (binary funtions). The predicate `Congruent2` corresponds to `congruent2` in Isabelle's standard `EquivClass` theory, but uses ZF-functions rather than meta-functions.

**definition**

```

Congruent2(r,f)  $\equiv$ 
 $(\forall x_1 x_2 y_1 y_2. \langle x_1, x_2 \rangle \in r \wedge \langle y_1, y_2 \rangle \in r \longrightarrow$ 
 $\langle f\langle x_1, y_1 \rangle, f\langle x_2, y_2 \rangle \rangle \in r)$ 

```

Next we define the notion of projecting a binary operation to the quotient space. This is a very important concept that allows to define quotient groups, among other things.

**definition**

```

ProjFun2(A,r,f)  $\equiv$ 
 $\{\langle p, \bigcup z \in \text{fst}(p) \times \text{snd}(p). r\{f(z)\} \rangle. p \in (A//r) \times (A//r) \}$ 

```

The following lemma is a two-variables equivalent of `EquivClass_1_L3`.

```

lemma EquivClass_1_L7:
  assumes A1: equiv(A,r) and A2: Congruent2(r,f)
  and A3:  $C_1 \in A//r$   $C_2 \in A//r$ 
  and A4:  $z_1 \in C_1 \times C_2$   $z_2 \in C_1 \times C_2$ 
  shows  $r\{f(z_1)\} = r\{f(z_2)\}$ 
proof -
  from A4 obtain  $x_1 y_1 x_2 y_2$  where
     $x_1 \in C_1$  and  $y_1 \in C_2$  and  $z_1 = \langle x_1, y_1 \rangle$  and

### 18.3 Saturated sets

In this section we consider sets that are saturated with respect to an equivalence relation. A set  $A$  is saturated with respect to a relation  $r$  if  $A = r^{-1}(r(A))$ . For equivalence relations saturated sets are unions of equivalence classes. This makes them useful as a tool to define subsets of the quotient space using properties of representants. Namely, we often define a set  $B \subseteq X/r$  by saying that  $[x]_r \in B$  iff  $x \in A$ . If  $A$  is a saturated set, this definition is consistent in the sense that it does not depend on the choice of  $x$  to represent  $[x]_r$ .

The following defines the notion of a saturated set. Recall that in Isabelle  $r^{-1}(A)$  is the inverse image of  $A$  with respect to relation  $r$ . This definition is not specific to equivalence relations.

#### definition

```

IsSaturated(r,A) ≡ A = r-1(r(A))

```

## 19 FiniteSeq\_ZF.thy

**theory** FiniteSeq\_ZF **imports** Nat\_ZF\_IML **func1**

**begin**

This theory treats finite sequences (i.e. maps  $n \rightarrow X$ , where  $n = \{0, 1, \dots, n-1\}$  is a natural number) as lists. It defines and proves the properties of basic operations on lists: concatenation, appending and element etc.

### 19.1 Lists as finite sequences

A natural way of representing (finite) lists in set theory is through (finite) sequences. In such view a list of elements of a set  $X$  is a function that maps the set  $\{0, 1, \dots, n-1\}$  into  $X$ . Since natural numbers in set theory are defined so that  $n = \{0, 1, \dots, n-1\}$ , a list of length  $n$  can be understood as an element of the function space  $n \rightarrow X$ .

We define the set of lists with values in set  $X$  as **Lists**( $X$ ).

**definition**

$$\mathbf{Lists}(X) \equiv \bigcup_{n \in \mathbf{nat.}} (n \rightarrow X)$$

The set of nonempty  $X$ -value listst will be called **NELists**( $X$ ).

**definition**

$$\mathbf{NELists}(X) \equiv \bigcup_{n \in \mathbf{nat.}} (\mathbf{succ}(n) \rightarrow X)$$

We first define the shift that moves the second sequence to the domain  $\{n, \dots, n+k-1\}$ , where  $n, k$  are the lengths of the first and the second sequence, resp. To understand the notation in the definitions below recall that in Isabelle/ZF **pred**( $n$ ) is the previous natural number and denotes the difference between natural numbers  $n$  and  $k$ .

**definition**

$$\mathbf{ShiftedSeq}(b, n) \equiv \{(j, b(j \#- n)). j \in \mathbf{NatInterval}(n, \mathbf{domain}(b))\}$$

We define concatenation of two sequences as the union of the first sequence with the shifted second sequence. The result of concatenating lists  $a$  and  $b$  is called **Concat**( $a, b$ ).

**definition**

$$\mathbf{Concat}(a, b) \equiv a \cup \mathbf{ShiftedSeq}(b, \mathbf{domain}(a))$$

For a finite sequence we define the sequence of all elements except the first one. This corresponds to the "tail" function in Haskell. We call it **Tail** here as well.

**definition**

$$\mathbf{Tail}(a) \equiv \{(k, a(\mathbf{succ}(k))). k \in \mathbf{pred}(\mathbf{domain}(a))\}$$

A dual notion to `Tail` is the list of all elements of a list except the last one. Borrowing the terminology from Haskell again, we will call this `Init`.

**definition**

`Init(a) ≡ restrict(a, pred(domain(a)))`

Another obvious operation we can talk about is appending an element at the end of a sequence. This is called `Append`.

**definition**

`Append(a, x) ≡ a ∪ {(domain(a), x)}`

If lists are modeled as finite sequences (i.e. functions on natural intervals  $\{0, 1, \dots, n-1\} = n$ ) it is easy to get the first element of a list as the value of the sequence at 0. The last element is the value at  $n-1$ . To hide this behind a familiar name we define the `Last` element of a list.

**definition**

`Last(a) ≡ a(pred(domain(a)))`

Shifted sequence is a function on a the interval of natural numbers.

**lemma** `shifted_seq_props`:

`assumes A1: n ∈ nat k ∈ nat and A2: b:k→X`

`shows`

`ShiftedSeq(b, n): NatInterval(n, k) → X`

`∀ i ∈ NatInterval(n, k). ShiftedSeq(b, n)(i) = b(i #- n)`

`∀ j ∈ k. ShiftedSeq(b, n)(n #+ j) = b(j)`

**proof** -

`let I = NatInterval(n, domain(b))`

`from A2 have Fact: I = NatInterval(n, k) using func1_1_L1 by simp`

`with A1 A2 have ∀ j ∈ I. b(j #- n) ∈ X`

## 19.2 Lists and cartesian products

Lists of length  $n$  of elements of some set  $X$  can be thought of as a model of the cartesian product  $X^n$  which is more convenient in many applications.

There is a natural bijection between the space  $(n+1) \rightarrow X$  of lists of length  $n+1$  of elements of  $X$  and the cartesian product  $(n \rightarrow X) \times X$ .

```

## 20 InductiveSeq\_ZF.thy

**theory** InductiveSeq\_ZF **imports** Nat\_ZF\_IML FiniteSeq\_ZF

**begin**

In this theory we discuss sequences defined by conditions of the form  $a_0 = x$ ,  $a_{n+1} = f(a_n)$  and similar.

### 20.1 Sequences defined by induction

One way of defining a sequence (that is a function  $a : \mathbb{N} \rightarrow X$ ) is to provide the first element of the sequence and a function to find the next value when we have the current one. This is usually called "defining a sequence by induction". In this section we set up the notion of a sequence defined by induction and prove the theorems needed to use it.

First we define a helper notion of the sequence defined inductively up to a given natural number  $n$ .

**definition**

InductiveSequenceN(x,f,n)  $\equiv$   
 THE a. a: succ(n)  $\rightarrow$  domain(f)  $\wedge$  a(0) = x  $\wedge$  ( $\forall k \in n$ . a(succ(k)) = f(a(k)))

From that we define the inductive sequence on the whole set of natural numbers. Recall that in Isabelle/ZF the set of natural numbers is denoted `nat`.

**definition**

InductiveSequence(x,f)  $\equiv \bigcup_{n \in \text{nat}} \text{InductiveSequenceN}(x,f,n)$

First we will consider the question of existence and uniqueness of finite inductive sequences. The proof is by induction and the next lemma is the  $P(0)$  step. To understand the notation recall that for natural numbers in set theory we have  $n = \{0, 1, \dots, n-1\}$  and  $\text{succ}(n) = \{0, 1, \dots, n\}$ .

**lemma** indseq\_exun0: **assumes** A1:  $f: X \rightarrow X$  **and** A2:  $x \in X$

**shows**

$\exists ! a. a: \text{succ}(0) \rightarrow X \wedge a(0) = x \wedge (\forall k \in 0. a(\text{succ}(k)) = f(a(k)))$

**proof**

**fix** a b

**assume** A3:

a:  $\text{succ}(0) \rightarrow X \wedge a(0) = x \wedge (\forall k \in 0. a(\text{succ}(k)) = f(a(k)))$

b:  $\text{succ}(0) \rightarrow X \wedge b(0) = x \wedge (\forall k \in 0. b(\text{succ}(k)) = f(b(k)))$

**moreover** have  $\text{succ}(0) = \{0\}$  **by** auto

**ultimately** have a:  $\{0\} \rightarrow X$  b:  $\{0\} \rightarrow X$  **by** auto

**then** have a =  $\{\langle 0, a(0) \rangle\}$  b =  $\{\langle 0, b(0) \rangle\}$  **using** func\_singleton\_pair

**by** auto

**with** A3 **show** a=b **by** simp

**next**

## 20.2 Images of inductive sequences

In this section we consider the properties of sets that are images of inductive sequences, that is are of the form  $\{f^{(n)}(x) : n \in N\}$  for some  $x$  in the domain of  $f$ , where  $f^{(n)}$  denotes the  $n$ 'th iteration of the function  $f$ . For a function  $f : X \rightarrow X$  and a point  $x \in X$  such set is sometimes called the orbit of  $x$  generated by  $f$ .

The basic properties of orbits.

### 20.3 Subsets generated by a binary operation

In algebra we often talk about sets "generated" by an element, that is sets of the form (in multiplicative notation)  $\{a^n | n \in \mathbb{Z}\}$ . This is related to a general notion of "power" (as in  $a^n = a \cdot a \cdot \dots \cdot a$ ) or multiplicity  $n \cdot a = a + a + \dots + a$ . The intuitive meaning of such notions is obvious, but we need to do some work to be able to use it in the formalized setting. This section is devoted to sequences that are created by repeatedly applying a binary operation with the second argument fixed to some constant.

Basic properties of sets generated by binary operations.

```

theorem binop_gen_set:
  assumes A1: f: X×Y → X and A2: x∈X y∈Y and
  A3: a = InductiveSequence(x,Fix2ndVar(f,y))
  shows
    a : nat → X
    a(nat) ∈ Pow(X)
    x ∈ a(nat)
    ∀z ∈ a(nat). Fix2ndVar(f,y)(z) ∈ a(nat)

## 20.4 Inductive sequences with changing generating function

A seemingly more general form of a sequence defined by induction is a sequence generated by the difference equation  $x_{n+1} = f_n(x_n)$  where  $n \mapsto f_n$  is a given sequence of functions such that each maps  $X$  into itself. For example when  $f_n(x) := x + x_n$  then the equation  $S_{n+1} = f_n(S_n)$  describes the sequence  $n \mapsto S_n = s_0 + \sum_{i=0}^n x_i$ , i.e. the sequence of partial sums of the sequence  $\{s_0, x_0, x_1, x_2, \dots\}$ .

The situation where the function that we iterate changes with  $n$  can be derived from the simpler case if we define the generating function appro-

privately. Namely, we replace the generating function in the definitions of `InductiveSequenceN` by the function  $f : X \times n \rightarrow X \times n$ ,  $f\langle x, k \rangle = \langle f_k(x), k + 1 \rangle$  if  $k < n$ ,  $\langle f_k(x), k \rangle$  otherwise. The first notion defines the expression we will use to define the generating function. To understand the notation recall that in standard Isabelle/ZF for a pair  $s = \langle x, n \rangle$  we have  $\text{fst}(s) = x$  and  $\text{snd}(s) = n$ .

**definition**

```
StateTransfFunNMeta(F,n,s)  $\equiv$ 
  if (snd(s)  $\in$  n) then (F(snd(s))(fst(s)), succ(snd(s))) else s
```

Then we define the actual generating function on sets of pairs from  $X \times \{0, 1, \dots, n\}$ .

**definition**

```
StateTransfFunN(X,F,n)  $\equiv$  {⟨s, StateTransfFunNMeta(F,n,s)⟩. s  $\in$  X $\times$ succ(n)}
```

Having the generating function we can define the expression that we can use to define the inductive sequence generates.

**definition**

```
StatesSeq(x,X,F,n)  $\equiv$ 
  InductiveSequenceN(⟨x,0⟩, StateTransfFunN(X,F,n),n)
```

Finally we can define the sequence given by a initial point  $x$ , and a sequence  $F$  of  $n$  functions.

**definition**

```
InductiveSeqVarFN(x,X,F,n)  $\equiv$  {⟨k,fst(StatesSeq(x,X,F,n)(k))⟩. k  $\in$  succ(n)}
```

The state transformation function (`StateTransfFunN` is a function that transforms  $X \times n$  into itself.

**lemma state\_trans\_fun:** *assumes* A1:  $n \in \text{nat}$  *and* A2:  $F: n \rightarrow (X \rightarrow X)$

*shows*  $\text{StateTransfFunN}(X,F,n): X \times \text{succ}(n) \rightarrow X \times \text{succ}(n)$

**proof** -

```

## 21 Fold\_ZF.thy

```
theory Fold_ZF imports InductiveSeq_ZF
```

```
begin
```

Suppose we have a binary operation  $P : X \times X \rightarrow X$  written multiplicatively as  $P\langle x, y \rangle = x \cdot y$ . In informal mathematics we can take a sequence  $\{x_k\}_{k \in 0..n}$  of elements of  $X$  and consider the product  $x_0 \cdot x_1 \cdot \dots \cdot x_n$ . To do the same thing in formalized mathematics we have to define precisely what is meant by that "...". The definition we want to use is based on the notion of sequence defined by induction discussed in `InductiveSeq_ZF`. We don't really want to derive the terminology for this from the word "product" as that would tie it conceptually to the multiplicative notation. This would be awkward when we want to reuse the same notions to talk about sums like  $x_0 + x_1 + \dots + x_n$ . In functional programming there is something called "fold". Namely for a function  $f$ , initial point  $a$  and list  $[b, c, d]$  the expression `fold(f, a, [b, c, d])` is defined to be  $f(f(f(a, b), c), d)$  (in Haskell something like this is called `foldl`). If we write  $f$  in multiplicative notation we get  $a \cdot b \cdot c \cdot d$ , so this is exactly what we need. The notion of folds in functional programming is actually much more general than what we need here (not that I know anything about that). In this theory file we just make a slight generalization and talk about folding a list with a binary operation  $f : X \times Y \rightarrow X$  with  $X$  not necessarily the same as  $Y$ .

### 21.1 Folding in ZF

Suppose we have a binary operation  $f : X \times Y \rightarrow X$ . Then every  $y \in Y$  defines a transformation of  $X$  defined by  $T_y(x) = f\langle x, y \rangle$ . In `IsarMathLib` such transformation is called as `Fix2ndVar(f, y)`. Using this notion, given a function  $f : X \times Y \rightarrow X$  and a sequence  $y = \{y_k\}_{k \in N}$  of elements of  $Y$  we can get a sequence of transformations of  $X$ . This is defined in `Seq2TransSeq` below. Then we use that sequence of transformations to define the sequence of partial folds (called `FoldSeq`) by means of `InductiveSeqVarFN` (defined in `InductiveSeq_ZF` theory) which implements the inductive sequence determined by a starting point and a sequence of transformations. Finally, we define the fold of a sequence as the last element of the sequence of the partial folds.

Definition that specifies how to convert a sequence  $a$  of elements of  $Y$  into a sequence of transformations of  $X$ , given a binary operation  $f : X \times Y \rightarrow X$ .

**definition**

$$\text{Seq2TrSeq}(f, a) \equiv \{\langle k, \text{Fix2ndVar}(f, a(k)) \rangle \mid k \in \text{domain}(a)\}$$

Definition of a sequence of partial folds.

**definition**

```
FoldSeq(f,x,a) ≡
InductiveSeqVarFN(x,fstdom(f),Seq2TrSeq(f,a),domain(a))
```

Definition of a fold.

**definition**

```
Fold(f,x,a) ≡ Last(FoldSeq(f,x,a))
```

If  $X$  is a set with a binary operation  $f : X \times Y \rightarrow X$  then  $\text{Seq2TransSeqN}(f,a)$  converts a sequence  $a$  of elements of  $Y$  into the sequence of corresponding transformations of  $X$ .

**lemma seq2trans\_seq\_props:**

```
assumes A1: n ∈ nat and A2: f : X×Y → X and A3: a:n→Y and
A4: T = Seq2TrSeq(f,a)
```

**shows**

```
T : n → (X→X) and
∀k∈n. ∀x∈X. (T(k))(x) = f⟨x,a(k)⟩
```

**proof -**

```
from 'a:n→Y' have D: domain(a) = n using func1_1_L1 by simp

  using seq2trans_seq_props FoldSeq_def fin_indseq_var_f_props
  by simp
moreover
{ fix k assume A5:  $k \in n$  hence  $k \in \text{succ}(n)$  by auto
  with A1 A2 A3 II A5 have  $(T(k))(F(k)) = f(F(k), y(k))$ 
    using apply_funtype seq2trans_seq_props by simp }
ultimately show  $\forall k \in n. F(\text{succ}(k)) = f(F(k), y(k))$ 
  by simp
qed

```

A consistency condition: if we make the list shorter, then we get a shorter sequence of partial folds with the same values as in the original sequence. This can be proven as a special case of `fin_indseq_var_f_restrict` but a proof using `fold_seq_props` and induction turns out to be shorter.

```

lemma foldseq_restrict: assumes
  n ∈ nat    k ∈ succ(n) and
  i ∈ nat    f : X×Y → X    a : n → Y    b : i → Y and
  n ⊆ i      ∀ j ∈ n. b(j) = a(j)    x ∈ X    Y ≠ 0
shows FoldSeq(f,x,b)(k) = FoldSeq(f,x,a)(k)
proof -
  let P = FoldSeq(f,x,a)
  let Q = FoldSeq(f,x,b)
  from assms have
    n ∈ nat    k ∈ succ(n)
    Q(0) = P(0) and
    ∀ j ∈ n. Q(j) = P(j) → Q(succ(j)) = P(succ(j))
    using fold_seq_props by auto
  then show Q(k) = P(k) by (rule fin_nat_ind)
qed

```

A special case of `foldseq_restrict` when the longer sequence is created from the shorter one by appending one element.

```

corollary fold_seq_append:
  assumes n ∈ nat    f : X×Y → X    a:n → Y and
  x∈X    k ∈ succ(n)    y∈Y
  shows FoldSeq(f,x,Append(a,y))(k) = FoldSeq(f,x,a)(k)
proof -
  let b = Append(a,y)
  from assms have b : succ(n) → Y    ∀ j ∈ n. b(j) = a(j)
    using append_props by auto
  with assms show thesis using foldseq_restrict by blast
qed

```

What we really will be using is the notion of the fold of a sequence, which we

define as the last element of (inductively defined) sequence of partial folds. The next theorem lists some properties of the product of the fold operation.

**theorem fold\_props:**

assumes A1:  $n \in \text{nat}$  and  
A2:  $f : X \times Y \rightarrow X \quad a : n \rightarrow Y \quad x \in X \quad Y \neq 0$   
shows  
 $\text{Fold}(f, x, a) = \text{FoldSeq}(f, x, a)(n)$  and  
 $\text{Fold}(f, x, a) \in X$

**proof -**

from assms have  $\text{FoldSeq}(f, x, a) : \text{succ}(n) \rightarrow X$   
using fold\_seq\_props by simp  
with A1 show  
 $\text{Fold}(f, x, a) = \text{FoldSeq}(f, x, a)(n)$  and  $\text{Fold}(f, x, a) \in X$   
using last\_seq\_elem apply\_funtype Fold\_def by auto

**qed**

A corner case: what happens when we fold an empty list?

**theorem fold\_empty:** assumes A1:  $f : X \times Y \rightarrow X$  and

A2:  $a : 0 \rightarrow Y \quad x \in X \quad Y \neq 0$   
shows  $\text{Fold}(f, x, a) = x$

**proof -**

let  $F = \text{FoldSeq}(f, x, a)$   
from assms have I:  
 $0 \in \text{nat} \quad f : X \times Y \rightarrow X \quad a : 0 \rightarrow Y \quad x \in X \quad Y \neq 0$   
by auto  
then have  $\text{Fold}(f, x, a) = F(0)$  by (rule fold\_props)  
moreover  
from I have  
 $0 \in \text{nat} \quad f : X \times Y \rightarrow X \quad a : 0 \rightarrow Y \quad x \in X \quad Y \neq 0$  and  
 $F = \text{FoldSeq}(f, x, a)$  by auto  
then have  $F(0) = x$  by (rule fold\_seq\_props)  
ultimately show  $\text{Fold}(f, x, a) = x$  by simp

**qed**

The next theorem tells us what happens to the fold of a sequence when we add one more element to it.

**theorem fold\_append:**

assumes A1:  $n \in \text{nat}$  and A2:  $f : X \times Y \rightarrow X$  and  
A3:  $a : n \rightarrow Y$  and A4:  $x \in X$  and A5:  $y \in Y$   
shows  
 $\text{FoldSeq}(f, x, \text{Append}(a, y))(n) = \text{Fold}(f, x, a)$  and  
 $\text{Fold}(f, x, \text{Append}(a, y)) = f(\text{Fold}(f, x, a), y)$

**proof -**

let  $b = \text{Append}(a, y)$   
let  $P = \text{FoldSeq}(f, x, b)$   
from A5 have I:  $Y \neq 0$  by auto  
with assms show thesis1:  $P(n) = \text{Fold}(f, x, a)$   
using fold\_seq\_append fold\_props by simp

```

from assms I have II:
  succ(n) ∈ nat    f : X×Y → X
  b : succ(n) → Y  x∈X  Y ≠ 0
  P = FoldSeq(f,x,b)
  using append_props by auto
then have
  ∀k ∈ succ(n). P(succ(k)) = f⟨P(k), b(k)⟩
  by (rule fold_seq_props)
with A3 A5 thesis1 have P(succ(n)) = f⟨Fold(f,x,a), y⟩
  using append_props by auto
moreover
from II have P : succ(succ(n)) → X
  by (rule fold_seq_props)
then have Fold(f,x,b) = P(succ(n))
  using last_seq_elem Fold_def by simp
ultimately show Fold(f,x,Append(a,y)) = f⟨Fold(f,x,a), y⟩
  by simp
qed

end

```

## 22 Partitions\_ZF.thy

**theory** Partitions\_ZF **imports** Finite\_ZF FiniteSeq\_ZF

**begin**

It is a common trick in proofs that we divide a set into non-overlapping subsets. The first case is when we split the set into two nonempty disjoint sets. Here this is modeled as an ordered pair of sets and the set of such divisions of set  $X$  is called  $\text{Bisections}(X)$ . The second variation on this theme is a set-valued function (aren't they all in ZF?) whose values are nonempty and mutually disjoint.

### 22.1 Bisections

This section is about dividing sets into two non-overlapping subsets.

The set of bisections of a given set  $A$  is a set of pairs of nonempty subsets of  $A$  that do not overlap and their union is equal to  $A$ .

**definition**

$\text{Bisections}(X) = \{p \in \text{Pow}(X) \times \text{Pow}(X) .$   
 $\text{fst}(p) \neq 0 \wedge \text{snd}(p) \neq 0 \wedge \text{fst}(p) \cap \text{snd}(p) = 0 \wedge \text{fst}(p) \cup \text{snd}(p) = X\}$

Properties of bisections.

**lemma** `bisec_props`: **assumes**  $\langle A, B \rangle \in \text{Bisections}(X)$  **shows**  
 $A \neq 0 \ B \neq 0 \ A \subseteq X \ B \subseteq X \ A \cap B = 0 \ A \cup B = X \ X \neq 0$   
**using** `assms Bisections_def` **by** `auto`

Kind of inverse of `bisec_props`: a pair of nonempty disjoint sets form a bisection of their union.

**lemma** `is_bisec`:  
**assumes**  $A \neq 0 \ B \neq 0 \ A \cap B = 0$   
**shows**  $\langle A, B \rangle \in \text{Bisections}(A \cup B)$  **using** `assms Bisections_def`  
**by** `auto`

Bisection of  $X$  is a pair of subsets of  $X$ .

**lemma** `bisec_is_pair`: **assumes**  $Q \in \text{Bisections}(X)$   
**shows**  $Q = \langle \text{fst}(Q), \text{snd}(Q) \rangle$   
**using** `assms Bisections_def` **by** `auto`

The set of bisections of the empty set is empty.

**lemma** `bisec_empty`: **shows**  $\text{Bisections}(0) = 0$   
**using** `Bisections_def` **by** `auto`

The next lemma shows what can we say about bisections of a set with another element added.

**lemma** `bisec_add_point`:

```

assumes A1:  $x \notin X$  and A2:  $\langle A, B \rangle \in \text{Bisections}(X \cup \{x\})$ 
shows  $(A = \{x\} \vee B = \{x\}) \vee (\langle A - \{x\}, B - \{x\} \rangle \in \text{Bisections}(X))$ 
proof -
  { assume  $A \neq \{x\}$  and  $B \neq \{x\}$ 
    with A2 have  $A - \{x\} \neq 0$  and  $B - \{x\} \neq 0$ 
  }
using singl_diff_empty Bisections_def
by auto
  moreover have  $(A - \{x\}) \cup (B - \{x\}) = X$ 
  proof -
    have  $(A - \{x\}) \cup (B - \{x\}) = (A \cup B) - \{x\}$ 
    by auto
  also from assms have  $(A \cup B) - \{x\} = X$ 
  using Bisections_def by auto
  finally show thesis by simp
qed
  moreover from A2 have  $(A - \{x\}) \cap (B - \{x\}) = 0$ 
using Bisections_def by auto
  ultimately have  $\langle A - \{x\}, B - \{x\} \rangle \in \text{Bisections}(X)$ 
using Bisections_def by auto
} thus thesis by auto
qed

```

A continuation of the lemma `bisec_add_point` that refines the case when the pair with removed point bisects the original set.

```

lemma bisec_add_point_case3:
  assumes A1:  $\langle A, B \rangle \in \text{Bisections}(X \cup \{x\})$ 
  and A2:  $\langle A - \{x\}, B - \{x\} \rangle \in \text{Bisections}(X)$ 
  shows
     $(\langle A, B - \{x\} \rangle \in \text{Bisections}(X) \wedge x \in B) \vee$ 
     $(\langle A - \{x\}, B \rangle \in \text{Bisections}(X) \wedge x \in A)$ 
  proof -
    from A1 have  $x \in A \cup B$ 
    using Bisections_def by auto
    hence  $x \in A \vee x \in B$  by simp
    from A1 have  $A - \{x\} = A \vee B - \{x\} = B$ 
    using Bisections_def by auto
    moreover
    { assume  $A - \{x\} = A$ 
      with A2 ' $x \in A \cup B$ ' have
         $\langle A, B - \{x\} \rangle \in \text{Bisections}(X) \wedge x \in B$ 
        using singl_diff_eq by simp }
    moreover
    { assume  $B - \{x\} = B$ 
      with A2 ' $x \in A \cup B$ ' have
         $\langle A - \{x\}, B \rangle \in \text{Bisections}(X) \wedge x \in A$ 
        using singl_diff_eq by simp }
    ultimately show thesis by auto
  qed

```

Another lemma about bisecting a set with an added point.

```
lemma point_set_bisec:
  assumes A1:  $x \notin X$  and A2:  $\langle \{x\}, A \rangle \in \text{Bisections}(X \cup \{x\})$ 
  shows  $A = X$  and  $X \neq 0$ 
proof -
  from A2 have  $A \subseteq X$  using Bisections_def by auto
  moreover
  { fix a assume  $a \in X$ 
    with A2 have  $a \in \{x\} \cup A$  using Bisections_def by simp
    with A1 ' $a \in X$ ' have  $a \in A$  by auto }
  ultimately show  $A = X$  by auto
  with A2 show  $X \neq 0$  using Bisections_def by simp
qed
```

Yet another lemma about bisecting a set with an added point, very similar to point\_set\_bisec with almost the same proof.

```
lemma set_point_bisec:
  assumes A1:  $x \notin X$  and A2:  $\langle A, \{x\} \rangle \in \text{Bisections}(X \cup \{x\})$ 
  shows  $A = X$  and  $X \neq 0$ 
proof -
  from A2 have  $A \subseteq X$  using Bisections_def by auto
  moreover
  { fix a assume  $a \in X$ 
    with A2 have  $a \in A \cup \{x\}$  using Bisections_def by simp
    with A1 ' $a \in X$ ' have  $a \in A$  by auto }
  ultimately show  $A = X$  by auto
  with A2 show  $X \neq 0$  using Bisections_def by simp
qed
```

If a pair of sets bisects a finite set, then both elements of the pair are finite.

```
lemma bisect_fin:
  assumes A1:  $A \in \text{FinPow}(X)$  and A2:  $Q \in \text{Bisections}(A)$ 
  shows  $\text{fst}(Q) \in \text{FinPow}(X)$  and  $\text{snd}(Q) \in \text{FinPow}(X)$ 
proof -
  from A2 have  $\langle \text{fst}(Q), \text{snd}(Q) \rangle \in \text{Bisections}(A)$ 
    using bisec_is_pair by simp
  then have  $\text{fst}(Q) \subseteq A$  and  $\text{snd}(Q) \subseteq A$ 
    using bisec_props by auto
  with A1 show  $\text{fst}(Q) \in \text{FinPow}(X)$  and  $\text{snd}(Q) \in \text{FinPow}(X)$ 
    using FinPow_def subset_Finite by auto
qed
```

## 22.2 Partitions

This sections covers the situation when we have an arbitrary number of sets we want to partition into.

We define a notion of a partition as a set valued function such that the values for different arguments are disjoint. The name is derived from the fact that

such function "partitions" the union of its arguments. Please let me know if you have a better idea for a name for such notion. We would prefer to say "is a partition", but that reserves the letter "a" as a keyword(?) which causes problems.

**definition**

```
Partition (_ {is partition} [90] 91) where
P {is partition}  $\equiv \forall x \in \text{domain}(P).$ 
 $P(x) \neq 0 \wedge (\forall y \in \text{domain}(P). x \neq y \longrightarrow P(x) \cap P(y) = 0)$ 
```

A fact about lists of mutually disjoint sets.

**lemma** list\_partition: assumes A1:  $n \in \text{nat}$  and

A2:  $a : \text{succ}(n) \rightarrow X$   $a$  {is partition}

shows  $(\bigcup_{i \in n}. a(i)) \cap a(n) = 0$

**proof** -

```
{ assume  $(\bigcup_{i \in n}. a(i)) \cap a(n) \neq 0$ 
  then have  $\exists x. x \in (\bigcup_{i \in n}. a(i)) \cap a(n)$ 
    by (rule nonempty_has_element)
  then obtain x where  $x \in (\bigcup_{i \in n}. a(i))$  and I:  $x \in a(n)$ 
    by auto
  then obtain i where  $i \in n$  and  $x \in a(i)$  by auto
  with A2 I have False
    using mem_imp_not_eq func1_1_L1 Partition_def
    by auto
} thus thesis by auto
```

qed

We can turn every injection into a partition.

**lemma** inj\_partition:

assumes A1:  $b \in \text{inj}(X, Y)$

shows

$\forall x \in X. \{ \langle x, \{b(x)\} \rangle. x \in X \} (x) = \{b(x)\}$  and

$\{ \langle x, \{b(x)\} \rangle. x \in X \}$  {is partition}

**proof** -

```
let p =  $\{ \langle x, \{b(x)\} \rangle. x \in X \}$ 
{ fix x assume  $x \in X$ 
  from A1 have  $b : X \rightarrow Y$  using inj_def
    by simp
  with 'x  $\in X$ ' have  $\{b(x)\} \in \text{Pow}(Y)$ 
    using apply_funtype by simp
} hence  $\forall x \in X. \{b(x)\} \in \text{Pow}(Y)$  by simp
then have  $p : X \rightarrow \text{Pow}(Y)$  using ZF_fun_from_total

## 23 Enumeration\_ZF.thy

```
theory Enumeration_ZF imports NatOrder_ZF FiniteSeq_ZF FinOrd_ZF
```

```
begin
```

Suppose  $r$  is a linear order on a set  $A$  that has  $n$  elements, where  $n \in \mathbb{N}$ . In the `FinOrd_ZF` theory we prove a theorem stating that there is a unique order isomorphism between  $n = \{0, 1, \dots, n-1\}$  (with natural order) and  $A$ . Another way of stating that is that there is a unique way of counting the elements of  $A$  in the order increasing according to relation  $r$ . Yet another way of stating the same thing is that there is a unique sorted list of elements of  $A$ . We will call this list the `Enumeration` of  $A$ .

### 23.1 Enumerations: definition and notation

In this section we introduce the notion of enumeration and define a proof context (a "locale" in Isabelle terms) that sets up the notation for writing about enumerations.

We define enumeration as the only order isomorphism between a set  $A$  and the number of its elements. We are using the formula  $\bigcup\{x\} = x$  to extract the only element from a singleton. `Le` is the (natural) order on natural numbers, defined in `Nat_ZF` theory in the standard Isabelle library.

**definition**

$$\text{Enumeration}(A, r) \equiv \bigcup \text{ord\_iso}(|A|, \text{Le}, A, r)$$

To set up the notation we define a locale `enums`. In this locale we will assume that  $r$  is a linear order on some set  $X$ . In most applications this set will be just the set of natural numbers. Standard Isabelle uses  $\leq$  to denote the "less or equal" relation on natural numbers. We will use the  $\leq$  symbol to denote the relation  $r$ . Those two symbols usually look the same in the presentation, but they are different in the source. To shorten the notation the enumeration `Enumeration(A, r)` will be denoted as  $\sigma(A)$ . Similarly as in the `Semigroup` theory we will write  $a \leftarrow x$  for the result of appending an element  $x$  to the finite sequence (list)  $a$ . Finally,  $a \sqcup b$  will denote the concatenation of the lists  $a$  and  $b$ .

**locale** `enums` =

```
fixes X r
assumes linord: IsLinOrder(X, r)

fixes ler (infix ≤ 70)
defines ler_def[simp]: x ≤ y ≡ ⟨x, y⟩ ∈ r

fixes σ
```

```

defines  $\sigma\_def$  [simp]:  $\sigma(A) \equiv Enumeration(A,r)$ 

fixes append (infix  $\hookrightarrow$  72)
defines append_def[simp]:  $a \hookrightarrow x \equiv Append(a,x)$ 

fixes concat (infixl  $\sqcup$  69)
defines concat_def[simp]:  $a \sqcup b \equiv Concat(a,b)$ 

```

## 23.2 Properties of enumerations

In this section we prove basic facts about enumerations.

A special case of the existence and uniqueness of the order isomorphism for finite sets when the first set is a natural number.

```

lemma (in enums) ord_iso_nat_fin:
  assumes  $A \in \text{FinPow}(X)$  and  $n \in \text{nat}$  and  $A \approx n$ 
  shows  $\exists ! f. f \in \text{ord\_iso}(n, \text{Le}, A, r)$

## 24 Semigroup\_ZF.thy

```
theory Semigroup_ZF imports Partitions_ZF Fold_ZF Enumeration_ZF
```

```
begin
```

It seems that the minimal setup needed to talk about a product of a sequence is a set with a binary operation. Such object is called "magma". However, interesting properties show up when the binary operation is associative and such algebraic structure is called a semigroup. In this theory file we define and study sequences of partial products of sequences of magma and semigroup elements.

### 24.1 Products of sequences of semigroup elements

Semigroup is a magma in which the binary operation is associative. In this section we mostly study the products of sequences of elements of semigroup. The goal is to establish the fact that taking the product of a sequence is distributive with respect to concatenation of sequences, i.e for two sequences  $a, b$  of the semigroup elements we have  $\prod(a \sqcup b) = (\prod a) \cdot (\prod b)$ , where " $a \sqcup b$ " is concatenation of  $a$  and  $b$  ( $a++b$  in Haskell notation). Less formally, we want to show that we can discard parantheses in expressions of the form  $(a_0 \cdot a_1 \cdot \dots \cdot a_n) \cdot (b_0 \cdot \dots \cdot b_k)$ .

First we define a notion similar to `Fold`, except that the initial element of the fold is given by the first element of sequence. By analogy with Haskell fold we call that `Fold1`

**definition**

```
Fold1(f,a)  $\equiv$  Fold(f,a(0),Tail(a))
```

The definition of the `semigr0` context below introduces notation for writing about finite sequences and semigroup products. In the context we fix the carrier and denote it  $G$ . The binary operation on  $G$  is called  $f$ . All theorems proven in the context `semigr0` will implicitly assume that  $f$  is an associative operation on  $G$ . We will use multiplicative notation for the semigroup operation. The product of a sequence  $a$  is denoted  $\prod a$ . We will write  $a \leftarrow x$  for the result of appending an element  $x$  to the finite sequence (list)  $a$ . This is a bit nonstandard, but I don't have a better idea for the "append" notation. Finally,  $a \sqcup b$  will denote the concatenation of the lists  $a$  and  $b$ .

```
locale semigr0 =
```

```
  fixes G f
```

```
  assumes assoc_assum: f {is associative on} G
```

```
  fixes prod (infixl  $\cdot$  72)
```

```

## 24.2 Products over sets of indices

In this section we study the properties of expressions of the form  $\prod_{i \in \Lambda} a_i = a_{i_0} \cdot a_{i_1} \cdot \dots \cdot a_{i_{n-1}}$ , i.e. what we denote as  $\prod(\Lambda, a)$ .  $\Lambda$  here is a finite subset of some set  $X$  and  $a$  is a function defined on  $X$  with values in the semigroup  $G$ .

Suppose  $a : X \rightarrow G$  is an indexed family of elements of a semigroup  $G$  and  $\Lambda = \{i_0, i_1, \dots, i_{n-1}\} \subseteq \mathbb{N}$  is a finite set of indices. We want to define  $\prod_{i \in \Lambda} a_i = a_{i_0} \cdot a_{i_1} \cdot \dots \cdot a_{i_{n-1}}$ . To do that we use the notion of **Enumeration** defined in the **Enumeration\_ZF** theory file that takes a set of indices and lists them in increasing order, thus converting it to list. Then we use the **Fold1** to multiply the resulting list. Recall that in Isabelle/ZF the capital letter "O" denotes the composition of two functions (or relations).

### definition

$\text{SetFold}(f, a, \Lambda, r) = \text{Fold1}(f, a \circ \text{Enumeration}(\Lambda, r))$

For a finite subset  $\Lambda$  of a linearly ordered set  $X$  we will write  $\sigma(\Lambda)$  to denote the enumeration of the elements of  $\Lambda$ , i.e. the only order isomorphism  $|\Lambda| \rightarrow \Lambda$ , where  $|\Lambda| \in \mathbb{N}$  is the number of elements of  $\Lambda$ . We also define notation for taking a product over a set of indices of some sequence of semigroup elements. The product of semigroup elements over some set  $\Lambda \subseteq X$  of indices of a sequence  $a : X \rightarrow G$  (i.e.  $\prod_{i \in \Lambda} a_i$ ) is denoted  $\prod(\Lambda, a)$ . In the **semigr1** context we assume that  $a$  is a function defined on some linearly

ordered set  $X$  with values in the semigroup  $G$ .

```

### 24.3 Commutative semigroups

Commutative semigroups are those whose operation is commutative, i.e.  $a \cdot b = b \cdot a$ . This implies that for any permutation  $s : n \rightarrow n$  we have  $\prod_{j=0}^n a_j = \prod_{j=0}^n a_{s(j)}$ , or, closer to the notation we are using in the `semigr0` context,  $\prod a = \prod(a \circ s)$ . Maybe one day we will be able to prove this, but for now the goal is to prove something simpler: that if the semigroup operation is commutative taking the product of a sequence is distributive with respect to the operation:  $\prod_{j=0}^n (a_j \cdot b_j) = \left(\prod_{j=0}^n a_j\right) \left(\prod_{j=0}^n b_j\right)$ . Many of the rearrangements (namely those that don't use the inverse) proven in the `AbelianGroup_ZF` theory hold in fact in semigroups. Some of them will be reproven in this section.

A rearrangement with 3 elements.

```

lemma (in semigr0) rearr3elems:
  assumes f {is commutative on} G and a ∈ G b ∈ G c ∈ G
  shows a · b · c = a · c · b
  using assms semigr_assoc IsCommutative_def by simp

```

A rearrangement of four elements.

```

lemma (in semigr0) rearr4elems:
  assumes A1: f {is commutative on} G and
  A2: a ∈ G b ∈ G c ∈ G d ∈ G
  shows a · b · (c · d) = a · c · (b · d)
proof -

```

```

For commutative operations taking the product of a sequence is distributive with respect to the operation. This version will probably not be used in applications, it is formulated in a way that is easier to prove by induction. For a more convenient formulation see `prod_comm_distrib`. The proof by induction on the length of the sequence.

```

theorem (in semigr0) prod_comm_distr:

The definition of the product  $\prod(A, a) \equiv \text{SetFold}(f, a, A, r)$  of a some (finite) set of semigroup elements requires that  $r$  is a linear order on the set of indices  $A$ . This is necessary so that we know in which order we are multiplying the elements. The product over  $A$  is defined so that we have  $\prod_A a = \prod a \circ \sigma(A)$  where  $\sigma : |A| \rightarrow A$  is the enumeration of  $A$  (the only order isomorphism between the number of elements in  $A$  and  $A$ ), see lemma `setproddef`. However, if the operation is commutative, the order is irrelevant. The next theorem formalizes that fact stating that we can replace the enumeration  $\sigma(A)$  by any bijection between  $|A|$  and  $A$ . In a way this is a generalization of `setproddef`. The proof is based on application of `prod_list_of_sets` to the finite collection of singletons that comprise  $A$ .

## 25 CommutativeSemigroup\_ZF.thy

```
theory CommutativeSemigroup_ZF imports Semigroup_ZF
```

```
begin
```

In the `Semigroup` theory we introduced a notion of `SetFold(f,a,Λ,r)` that represents the sum of values of some function  $a$  valued in a semigroup where the arguments of that function vary over some set  $\Lambda$ . Using the additive notation something like this would be expressed as  $\sum_{x \in \Lambda} f(x)$  in informal mathematics. This theory considers an alternative to that notion that is more specific to commutative semigroups.

### 25.1 Sum of a function over a set

The  $r$  parameter in the definition of `SetFold(f,a,Λ,r)` (from `Semigroup_ZF`) represents a linear order relation on  $\Lambda$  that is needed to indicate in what order we are summing the values  $f(x)$ . If the semigroup operation is commutative the order does not matter and the relation  $r$  is not needed. In this section we define a notion of summing up values of some function  $a : X \rightarrow G$  over a finite set of indices  $\Gamma \subseteq X$ , without using any order relation on  $X$ .

We define the sum of values of a function  $a : X \rightarrow G$  over a set  $\Lambda$  as the only element of the set of sums of lists that are bijections between the number of values in  $\Lambda$  (which is a natural number  $n = \{0, 1, \dots, n-1\}$  if  $\Lambda$  is finite) and  $\Lambda$ . The notion of `Fold1(f,c)` is defined in `Semigroup_ZF` as the fold (sum) of the list  $c$  starting from the first element of that list. The intention is to use the fact that since the result of summing up a list does not depend on the order, the set  $\{\text{Fold1}(f,a \circ b) \mid b \in \text{bij}(|\Lambda|, \Lambda)\}$  is a singleton and we can extract its only value by taking its union.

**definition**

$$\text{CommSetFold}(f,a,\Lambda) = \bigcup \{\text{Fold1}(f,a \circ b) \mid b \in \text{bij}(|\Lambda|, \Lambda)\}$$

the next locale sets up notation for writing about summation in commutative semigroups. We define two kinds of sums. One is the sum of elements of a list (which are just functions defined on a natural number) and the second one represents a more general notion the sum of values of a semigroup valued function over some set of arguments. Since those two types of sums are different notions they are represented by different symbols. However in the presentations they are both intended to be printed as  $\sum$ .

```

The next lemma states that the result of a sum does not depend on the order we calculate it. This is similar to lemma `prod_order_irr` in the `Semigroup` theory, except that the `semigr1` locale assumes that the domain of the function we sum up is linearly ordered, while in `commsemigr` we don't have this assumption.

```

## 26 Monoid\_ZF.thy

```
theory Monoid_ZF imports func_ZF
```

```
begin
```

This theory provides basic facts about monoids.

### 26.1 Definition and basic properties

In this section we talk about monoids. The notion of a monoid is similar to the notion of a semigroup except that we require the existence of a neutral element. It is also similar to the notion of group except that we don't require existence of the inverse.

Monoid is a set  $G$  with an associative operation and a neutral element. The operation is a function on  $G \times G$  with values in  $G$ . In the context of ZF set theory this means that it is a set of pairs  $\langle x, y \rangle$ , where  $x \in G \times G$  and  $y \in G$ . In other words the operation is a certain subset of  $(G \times G) \times G$ . We express all this by defining a predicate  $\text{IsAmonoid}(G, f)$ . Here  $G$  is the "carrier" of the group and  $f$  is the binary operation on it.

**definition**

```
IsAmonoid(G,f)  $\equiv$ 
f {is associative on} G  $\wedge$ 
( $\exists e \in G. (\forall g \in G. (f(\langle e, g \rangle) = g) \wedge (f(\langle g, e \rangle) = g)))$ 
```

The next locale called "monoid0" defines a context for theorems that concern monoids. In this context we assume that the pair  $(G, f)$  is a monoid. We will use the  $\oplus$  symbol to denote the monoid operation (for no particular reason).

```
locale monoid0 =
```

```
  fixes G
  fixes f
  assumes monoidAsssum: IsAmonoid(G,f)

  fixes monoper (infixl  $\oplus$  70)
  defines monoper_def [simp]:  $a \oplus b \equiv f(\langle a, b \rangle)$ 
```

The result of the monoid operation is in the monoid (carrier).

## 27 Group\_ZF.thy

**theory** Group\_ZF **imports** Monoid\_ZF

**begin**

This theory file covers basics of group theory.

### 27.1 Definition and basic properties of groups

In this section we define the notion of a group and set up the notation for discussing groups. We prove some basic theorems about groups.

To define a group we take a monoid and add a requirement that the right inverse needs to exist for every element of the group.

**definition**

$\text{IsAgroup}(G, f) \equiv$   
 $(\text{IsAmonoid}(G, f) \wedge (\forall g \in G. \exists b \in G. f\langle g, b \rangle = \text{TheNeutralElement}(G, f)))$

We define the group inverse as the set  $\{\langle x, y \rangle \in G \times G : x \cdot y = e\}$ , where  $e$  is the neutral element of the group. This set (which can be written as  $(\cdot)^{-1}\{e\}$ ) is a certain relation on the group (carrier). Since, as we show later, for every  $x \in G$  there is exactly one  $y \in G$  such that  $x \cdot y = e$  this relation is in fact a function from  $G$  to  $G$ .

**definition**

$\text{GroupInv}(G, f) \equiv \{\langle x, y \rangle \in G \times G. f\langle x, y \rangle = \text{TheNeutralElement}(G, f)\}$

We will use the multiplicative notation for groups. The neutral element is denoted 1.

**locale** group0 =

fixes G

fixes P

assumes groupAssum: IsAgroup(G, P)

fixes neut (1)

defines neut\_def[simp]:  $1 \equiv \text{TheNeutralElement}(G, P)$

fixes proper (infixl  $\cdot$  70)

defines proper\_def[simp]:  $a \cdot b \equiv P\langle a, b \rangle$

fixes inv ( $_^{-1}$  [90] 91)

defines inv\_def[simp]:  $x^{-1} \equiv \text{GroupInv}(G, P)(x)$

First we show a lemma that says that we can use theorems proven in the monoid0 context (locale).

**lemma** (in group0) group0\_2\_L1: **shows** monoid0(G, P)

**using** groupAssum IsAgroup\_def monoid0\_def **by** simp

In some strange cases Isabelle has difficulties with applying the definition of a group. The next lemma defines a rule to be applied in such cases.

```
lemma definition_of_group: assumes IsAmonoid(G,f)
  and  $\forall g \in G. \exists b \in G. f\langle g,b \rangle = \text{TheNeutralElement}(G,f)$ 
  shows IsAgroup(G,f)
  using assms IsAgroup_def by simp
```

A technical lemma that allows to use 1 as the neutral element of the group without referencing a list of lemmas and definitions.

```
lemma (in group0) group0_2_L2:
  shows  $1 \in G \wedge (\forall g \in G. (1 \cdot g = g \wedge g \cdot 1 = g))$ 
  using group0_2_L1 monoid0.unit_is_neutral by simp
```

The group is closed under the group operation. Used all the time, useful to have handy.

```
lemma (in group0) group_op_closed: assumes a ∈ G b ∈ G
  shows a · b ∈ G using assms group0_2_L1 monoid0.group0_1_L1
  by simp
```

The group operation is associative. This is another technical lemma that allows to shorten the list of referenced lemmas in some proofs.

```
lemma (in group0) group_oper_assoc:
  assumes a ∈ G b ∈ G c ∈ G shows a · (b · c) = a · b · c
  using groupAssum assms IsAgroup_def IsAmonoid_def
  IsAssociative_def group_op_closed by simp
```

The group operation maps  $G \times G$  into  $G$ . It is convenient to have this fact easily accessible in the group0 context.

```
lemma (in group0) group_oper_assocA: shows P :  $G \times G \rightarrow G$ 
  using groupAssum IsAgroup_def IsAmonoid_def IsAssociative_def
  by simp
```

The definition of a group requires the existence of the right inverse. We show that this is also the left inverse.

```
theorem (in group0) group0_2_T1:
  assumes A1:  $g \in G$  and A2:  $b \in G$  and A3:  $g \cdot b = 1$ 
  shows  $b \cdot g = 1$ 
proof -
  from A2 groupAssum obtain c where I:  $c \in G \wedge b \cdot c = 1$ 
  using IsAgroup_def by auto
  then have c ∈ G by simp
  have  $1 \in G$  using group0_2_L2 by simp
  with A1 A2 I have  $b \cdot g = b \cdot (g \cdot (b \cdot c))$ 
  using group_op_closed group0_2_L2 group_oper_assoc
  by simp
  also from A1 A2 'c ∈ G' have  $b \cdot (g \cdot (b \cdot c)) = b \cdot (g \cdot b \cdot c)$ 
  using group_oper_assoc by simp
```

```

    also from A3 A2 I have  $b \cdot (g \cdot b \cdot c) = 1$  using group0_2_L2 by simp
    finally show  $b \cdot g = 1$  by simp
qed

```

For every element of a group there is only one inverse.

```

lemma (in group0) group0_2_L4:
  assumes A1:  $x \in G$  shows  $\exists! y. y \in G \wedge x \cdot y = 1$ 
proof
  from A1 groupAssum show  $\exists y. y \in G \wedge x \cdot y = 1$ 
    using IsAgroup_def by auto
  fix y n
  assume A2:  $y \in G \wedge x \cdot y = 1$  and A3:  $n \in G \wedge x \cdot n = 1$  show  $y = n$ 
  proof -
    from A1 A2 have T1:  $y \cdot x = 1$ 
      using group0_2_T1 by simp
    from A2 A3 have  $y = y \cdot (x \cdot n)$ 
      using group0_2_L2 by simp
    also from A1 A2 A3 have  $\dots = (y \cdot x) \cdot n$ 
      using group_oper_assoc by blast
    also from T1 A3 have  $\dots = n$ 
      using group0_2_L2 by simp
    finally show  $y = n$  by simp
  qed

## 27.2 Subgroups

There are two common ways to define subgroups. One requires that the group operation is closed in the subgroup. The second one defines subgroup as a subset of a group which is itself a group under the group operations. We use the second approach because it results in shorter definition.

The rest of this section is devoted to proving the equivalence of these two definitions of the notion of a subgroup.

A pair  $(H, P)$  is a subgroup if  $H$  forms a group with the operation  $P$  restricted to  $H \times H$ . It may be surprising that we don't require  $H$  to be a subset of  $G$ . This however can be inferred from the definition if the pair  $(G, P)$  is a group, see lemma group0\_3\_L2.

**definition**

```

IsASubgroup(H,P) ≡ IsAgroup(H, restrict(P,H×H))

```

Formally the group operation in a subgroup is different than in the group as they have different domains. Of course we want to use the original operation with the associated notation in the subgroup. The next couple of lemmas will allow for that.

The next lemma states that the neutral element of a subgroup is in the subgroup and it is both right and left neutral there. The notation is very ugly because we don't want to introduce a separate notation for the subgroup operation.

```

lemma group0_3_L1:
  assumes A1: IsAsubgroup(H,f)
  and A2: n = TheNeutralElement(H,restrict(f,H×H))
  shows n ∈ H
  ∀h∈H. restrict(f,H×H)⟨n,h⟩ = h
  ∀h∈H. restrict(f,H×H)⟨h,n⟩ = h

## 28 Group\_ZF\_1.thy

**theory** Group\_ZF\_1 **imports** Group\_ZF

**begin**

In this theory we consider right and left translations and odd functions.

### 28.1 Translations

In this section we consider translations. Translations are maps  $T : G \rightarrow G$  of the form  $T_g(a) = g \cdot a$  or  $T_g(a) = a \cdot g$ . We also consider two-dimensional translations  $T_g : G \times G \rightarrow G \times G$ , where  $T_g(a, b) = (a \cdot g, b \cdot g)$  or  $T_g(a, b) = (g \cdot a, g \cdot b)$ .

For an element  $a \in G$  the right translation is defined a function (set of pairs) such that its value (the second element of a pair) is the value of the group operation on the first element of the pair and  $g$ . This looks a bit strange in the raw set notation, when we write a function explicitly as a set of pairs and value of the group operation on the pair  $\langle a, b \rangle$  as  $P\langle a, b \rangle$  instead of the usual infix  $a \cdot b$  or  $a + b$ .

**definition**

$$\text{RightTranslation}(G, P, g) \equiv \{ \langle a, b \rangle \in G \times G. P\langle a, g \rangle = b \}$$

A similar definition of the left translation.

**definition**

$$\text{LeftTranslation}(G, P, g) \equiv \{ \langle a, b \rangle \in G \times G. P\langle g, a \rangle = b \}$$

Translations map  $G$  into  $G$ . Two dimensional translations map  $G \times G$  into itself.

**lemma** (in group0) group0\_5\_L1: **assumes** A1:  $g \in G$

**shows**  $\text{RightTranslation}(G, P, g) : G \rightarrow G$  **and**  $\text{LeftTranslation}(G, P, g) : G \rightarrow G$

**proof** -

**from** A1 **have**  $\forall a \in G. a \cdot g \in G$  **and**  $\forall a \in G. g \cdot a \in G$

**using** group\_oper\_assocA **apply** funtype **by** auto

**then show**

$\text{RightTranslation}(G, P, g) : G \rightarrow G$

$\text{LeftTranslation}(G, P, g) : G \rightarrow G$

**using** RightTranslation\_def LeftTranslation\_def func1\_1\_L11A

**by** auto

**qed**

The values of the translations are what we expect.

**lemma** (in group0) group0\_5\_L2: **assumes**  $g \in G$   $a \in G$

**shows**

$\text{RightTranslation}(G, P, g)(a) = a \cdot g$

## 28.2 Odd functions

This section is about odd functions.

Odd functions are those that commute with the group inverse:  $f(a^{-1}) = (f(a))^{-1}$ .

**definition**

$$\text{IsOdd}(G, P, f) \equiv (\forall a \in G. f(\text{GroupInv}(G, P)(a)) = \text{GroupInv}(G, P)(f(a)) )$$

Let's see the definition of an odd function in a more readable notation.

```
lemma (in group0) group0_6_L1:
  shows IsOdd(G,P,p)  $\longleftrightarrow$  (  $\forall a \in G. p(a^{-1}) = (p(a))^{-1}$  )
  using IsOdd_def by simp
```

We can express the definition of an odd function in two ways.

```
lemma (in group0) group0_6_L2:
  assumes A1: p : G  $\rightarrow$  G
  shows
    ( $\forall a \in G. p(a^{-1}) = (p(a))^{-1}$ )  $\longleftrightarrow$  ( $\forall a \in G. (p(a^{-1}))^{-1} = p(a)$ )
proof

qed

end
```

## 29 Group\_ZF\_1b.thy

**theory** Group\_ZF\_1b **imports** Group\_ZF

**begin**

In a typical textbook a group is defined as a set  $G$  with an associative operation such that two conditions hold:

A: there is an element  $e \in G$  such that for all  $g \in G$  we have  $e \cdot g = g$  and  $g \cdot e = g$ . We call this element a "unit" or a "neutral element" of the group.

B: for every  $a \in G$  there exists a  $b \in G$  such that  $a \cdot b = e$ , where  $e$  is the element of  $G$  whose existence is guaranteed by A.

The validity of this definition is rather dubious to me, as condition A does not define any specific element  $e$  that can be referred to in condition B - it merely states that a set of such units  $e$  is not empty. Of course it does work in the end as we can prove that the set of such neutral elements has exactly one element, but still the definition by itself is not valid. You just can't reference a variable bound by a quantifier outside of the scope of that quantifier.

One way around this is to first use condition A to define the notion of a monoid, then prove the uniqueness of  $e$  and then use the condition B to define groups.

Another way is to write conditions A and B together as follows:

$$\exists e \in G (\forall g \in G e \cdot g = g \wedge g \cdot e = g) \wedge (\forall a \in G \exists b \in G a \cdot b = e).$$

This is rather ugly.

What I want to talk about is an amusing way to define groups directly without any reference to the neutral elements. Namely, we can define a group as a non-empty set  $G$  with an associative operation " $\cdot$ " such that

C: for every  $a, b \in G$  the equations  $a \cdot x = b$  and  $y \cdot a = b$  can be solved in  $G$ .

This theory file aims at proving the equivalence of this alternative definition with the usual definition of the group, as formulated in `Group_ZF.thy`. The informal proofs come from an Aug. 14, 2005 post by buli on the [matematyka.org](http://matematyka.org) forum.

### 29.1 An alternative definition of group

First we will define notation for writing about groups.

We will use the multiplicative notation for the group operation. To do this, we define a context (locale) that tells Isabelle to interpret  $a \cdot b$  as the value of function  $P$  on the pair  $\langle a, b \rangle$ .

**locale** group2 =  
  **fixes** P

```

fixes dot (infixl · 70)
defines dot_def [simp]: a · b ≡ P⟨a,b⟩

```

The next theorem states that a set  $G$  with an associative operation that satisfies condition C is a group, as defined in IsarMathLib Group\_ZF theory.

```

theorem (in group2) altgroup_is_group:
  assumes A1:  $G \neq 0$  and A2:  $P \text{ \{is associative on\} } G$ 
  and A3:  $\forall a \in G. \forall b \in G. \exists x \in G. a \cdot x = b$ 
  and A4:  $\forall a \in G. \forall b \in G. \exists y \in G. y \cdot a = b$ 
  shows IsAgroup( $G, P$ )
proof -
  from A1 obtain a where  $a \in G$  by auto
  with A3 obtain x where  $x \in G$  and  $a \cdot x = a$ 
  by auto
  from A4 ' $a \in G$ ' obtain y where  $y \in G$  and  $y \cdot a = a$ 
  by auto

```

The converse of altgroup\_is\_group: in every (classically defined) group condition C holds. In informal mathematics we can say "Obviously condition C

holds in any group.” In formalized mathematics the word ”obviously” is not in the language. The next theorem is proven in the context called `group0` defined in the theory `Group_ZF.thy`. Similarly to the `group2` that context defines  $a \cdot b$  as  $P\langle a, b \rangle$ . It also defines notation related to the group inverse and adds an assumption that the pair  $(G, P)$  is a group to all its theorems. This is why in the next theorem we don’t explicitly assume that  $(G, P)$  is a group - this assumption is implicit in the context.

```

theorem (in group0) group_is_altgroup: shows
   $\forall a \in G. \forall b \in G. \exists x \in G. a \cdot x = b$  and  $\forall a \in G. \forall b \in G. \exists y \in G. y \cdot a = b$ 
proof -
  { fix a b assume a ∈ G b ∈ G
    let x = a-1 · b
    let y = b · a-1
    from ‘a ∈ G’ ‘b ∈ G’ have
      x ∈ G y ∈ G and a · x = b y · a = b
      using inverse_in_group group_op_closed inv_cancel_two
      by auto
    hence  $\exists x \in G. a \cdot x = b$  and  $\exists y \in G. y \cdot a = b$  by auto
  } thus
     $\forall a \in G. \forall b \in G. \exists x \in G. a \cdot x = b$  and
     $\forall a \in G. \forall b \in G. \exists y \in G. y \cdot a = b$ 
    by auto
qed

end

```

## 30 AbelianGroup\_ZF.thy

**theory** AbelianGroup\_ZF **imports** Group\_ZF

**begin**

A group is called “abelian“ if its operation is commutative, i.e.  $P\langle a, b \rangle = P\langle b, a \rangle$  for all group elements  $a, b$ , where  $P$  is the group operation. It is customary to use the additive notation for abelian groups, so this condition is typically written as  $a + b = b + a$ . We will be using multiplicative notation though (in which the commutativity condition of the operation is written as  $a \cdot b = b \cdot a$ ), just to avoid the hassle of changing the notation we used for general groups.

### 30.1 Rearrangement formulae

This section is not interesting and should not be read. Here we will prove formulas in which right hand side uses the same factors as the left hand side, just in different order. These facts are obvious in informal math sense, but Isabelle prover is not able to derive them automatically, so we have to prove them by hand.

Proving the facts about associative and commutative operations is quite tedious in formalized mathematics. To a human the thing is simple: we can arrange the elements in any order and put parentheses wherever we want, it is all the same. However, formalizing this statement would be rather difficult (I think). The next lemma attempts a quasi-algorithmic approach to this type of problem. To prove that two expressions are equal, we first strip one from parentheses, then rearrange the elements in proper order, then put the parentheses where we want them to be. The algorithm for rearrangement is easy to describe: we keep putting the first element (from the right) that is in the wrong place at the left-most position until we get the proper arrangement. As far removing parentheses is concerned Isabelle does its job automatically.

```
lemma (in group0) group0_4_L2:
  assumes A1:P {is commutative on} G
  and A2:a∈G b∈G c∈G d∈G E∈G F∈G

theory Group_ZF_2 imports AbelianGroup_ZF func_ZF EquivClass1
```

```
begin
```

This theory continues Group\_ZF.thy and considers lifting the group structure to function spaces and projecting the group structure to quotient spaces, in particular the quotient group.

### 31.1 Lifting groups to function spaces

If we have a monoid (group)  $G$  then we get a monoid (group) structure on a space of functions valued in  $G$  by defining  $(f \cdot g)(x) := f(x) \cdot g(x)$ . We call this process "lifting the monoid (group) to function space". This section formalizes this lifting.

The lifted operation is an operation on the function space.

```
lemma (in monoid0) Group_ZF_2_1_L0A:
  assumes A1: F = f {lifted to function space over} X
  shows F : (X→G)×(X→G)→(X→G)

### 31.3 Normal subgroups and quotient groups

If  $H$  is a subgroup of  $G$ , then for every  $a \in G$  we can consider the sets  $\{a \cdot h \mid h \in H\}$  and  $\{h \cdot a \mid h \in H\}$  (called a left and right "coset of  $H$ ", resp.) These sets sometimes form a group, called the "quotient group". This section discusses the notion of quotient groups.

A normal subgroup  $N$  of a group  $G$  is such that  $aba^{-1}$  belongs to  $N$  if  $a \in G, b \in N$ .

**definition**

```

IsAnormalSubgroup(G,P,N)  $\equiv$  IsASubgroup(N,P)  $\wedge$ 
( $\forall n \in N. \forall g \in G. P\langle P\langle g, n \rangle, \text{GroupInv}(G,P)(g) \rangle \in N$ )

```

Having a group and a normal subgroup  $N$  we can create another group consisting of equivalence classes of the relation  $a \sim b \equiv a \cdot b^{-1} \in N$ . We will refer to this relation as the quotient group relation. The classes of this relation are in fact cosets of subgroup  $H$ .

**definition**

```

QuotientGroupRel(G,P,H)  $\equiv$ 
{⟨ a, b ⟩  $\in$  G  $\times$  G.  $P\langle a, \text{GroupInv}(G,P)(b) \rangle \in H$ }

```

Next we define the operation in the quotient group as the projection of the group operation on the classes of the quotient group relation.

**definition**

```

QuotientGroupOp(G,P,H)  $\equiv$  ProjFun2(G, QuotientGroupRel(G,P,H), P)

```

## 32 Group\_ZF\_3.thy

**theory** Group\_ZF\_3 **imports** Group\_ZF\_2 Finite1

**begin**

In this theory we consider notions in group theory that are useful for the construction of real numbers in the `Real_ZF_x` series of theories.

### 32.1 Group valued finite range functions

In this section show that the group valued functions  $f : X \rightarrow G$ , with the property that  $f(X)$  is a finite subset of  $G$ , is a group. Such functions play an important role in the construction of real numbers in the `Real_ZF` series.

The following proves the essential condition to show that the set of finite range functions is closed with respect to the lifted group operation.

```
lemma (in group0) Group_ZF_3_1_L1:
  assumes A1: F = P {lifted to function space over} X
  and
  A2: s ∈ FinRangeFunctions(X,G)  r ∈ FinRangeFunctions(X,G)
  shows F⟨ s,r⟩ ∈ FinRangeFunctions(X,G)
proof -
  let q = F⟨ s,r⟩

## 32.2 Almost homomorphisms

An almost homomorphism is a group valued function defined on a monoid  $M$  with the property that the set  $\{f(m+n) - f(m) - f(n)\}_{m,n \in M}$  is finite. This term is used by R. D. Arthan in "The Eudoxus Real Numbers". We use this term in the general group context and use the A'Campo's term "slopes" (see his "A natural construction for the real numbers") to mean an almost homomorphism mapping interegers into themselves. We consider almost homomorphisms because we use slopes to define real numbers in the `Real_ZF_x` series.

`HomDiff` is an acronym for "homomorphism difference". This is the expression  $s(mn)(s(m)s(n))^{-1}$ , or  $s(m+n) - s(m) - s(n)$  in the additive notation. It is equal to the neutral element of the group if  $s$  is a homomorphism.

**definition**

```
HomDiff(G,f,s,x) ≡
  f⟨s(f⟨fst(x),snd(x))⟩,
    (GroupInv(G,f)(f⟨s(fst(x)),s(snd(x))⟩))⟩
```

Almost homomorphisms are defined as those maps  $s : G \rightarrow G$  such that the homomorphism difference takes only finite number of values on  $G \times G$ .

**definition**

```
AlmostHoms(G,f) ≡
  {s ∈ G→G. {HomDiff(G,f,s,x). x ∈ G×G } ∈ Fin(G)}
```

`AlHomOp1(G, f)` is the group operation on almost homomorphisms defined in a natural way by  $(s \cdot r)(n) = s(n) \cdot r(n)$ . In the terminology defined in `func1.thy` this is the group operation  $f$  (on  $G$ ) lifted to the function space  $G \rightarrow G$  and restricted to the set `AlmostHoms(G, f)`.

**definition**

```
AlHomOp1(G,f) ≡
  restrict(f {lifted to function space over} G,
    AlmostHoms(G,f)×AlmostHoms(G,f))
```

We also define a composition (binary) operator on almost homomorphisms in a natural way. We call that operator `AlHomOp2` - the second operation on almost homomorphisms. Composition of almost homomorphisms is used to define multiplication of real numbers in `Real_ZF` series.

**definition**

```
AlHomOp2(G,f) ≡
  restrict(Composition(G),AlmostHoms(G,f)×AlmostHoms(G,f))
```

This lemma provides more readable notation for the `HomDiff` definition. Not really intended to be used in proofs, but just to see the definition in the notation defined in the `group0` locale.

**lemma** (in `group0`) `HomDiff_notation`:

```

shows HomDiff(G,P,s,< m,n>) = s(m·n)·(s(m)·s(n))-1
using HomDiff_def by simp

```

The next lemma shows the set from the definition of almost homomorphism in a different form.

```

lemma (in group0) Group_ZF_3_2_L1A: shows
  {HomDiff(G,P,s,x). x ∈ G×G} = {s(m·n)·(s(m)·s(n))-1. < m,n> ∈ G×G}
proof -
  have ∀m∈G.∀n∈G. HomDiff(G,P,s,< m,n>) = s(m·n)·(s(m)·s(n))-1
    using HomDiff_notation by simp
  then show thesis by (rule ZF1_1_L4A)

```

Let's define some notation. We inherit the notation and assumptions from the group0 context (locale) and add some. We will use AH to denote the set of almost homomorphisms.  $\sim$  is the inverse (negative if the group is the group of integers) of almost homomorphisms,  $(\sim p)(n) = p(n)^{-1}$ .  $\delta$  will denote the homomorphism difference specific for the group  $(\text{HomDiff}(G, f))$ . The notation  $s \approx r$  will mean that  $s, r$  are almost equal, that is they are in the equivalence relation defined by the group of finite range functions (that is a normal subgroup of almost homomorphisms, if the group is abelian). We show that this is equivalent to the set  $\{s(n) \cdot r(n)^{-1} : n \in G\}$  being finite. We also add an assumption that the  $G$  is abelian as many needed properties do not hold without that.

```

locale group1 = group0 +

## 32.4 Compositions of almost homomorphisms

The goal of this section is to establish some facts about composition of almost homomorphisms. needed for the real numbers construction in `Real_ZF_x` series. In particular we show that the set of almost homomorphisms is closed under composition and that composition is congruent with respect to the equivalence relation defined by the group of finite range functions (a normal subgroup of almost homomorphisms).

The next formula restates the definition of the homomorphism difference to express the value an almost homomorphism on a product.

```

lemma (in group1) Group_ZF_3_4_L1:
  assumes s∈AH and m∈G n∈G
  shows s(m·n) = s(m)·s(n)·δ(s,⟨ m,n⟩)

### 32.5 Shifting almost homomorphisms

In this section we consider what happens if we multiply an almost homomorphism by a group element. We show that the resulting function is also an a. h., and almost equal to the original one. This is used only for slopes (integer a.h.) in Int\_ZF\_2 where we need to correct a positive slopes by adding a constant, so that it is at least 2 on positive integers.

If  $s$  is an almost homomorphism and  $c$  is some constant from the group, then  $s \cdot c$  is an almost homomorphism.

```

### 33 DirectProduct\_ZF.thy

**theory** DirectProduct\_ZF **imports** func\_ZF

**begin**

This theory considers the direct product of binary operations. Contributed by Seo Sanghyeon.

#### 33.1 Definition

In group theory the notion of direct product provides a natural way of creating a new group from two given groups.

Given  $(G, \cdot)$  and  $(H, \circ)$  a new operation  $(G \times H, \times)$  is defined as  $(g, h) \times (g', h') = (g \cdot g', h \circ h')$ .

**definition**

```
DirectProduct(P,Q,G,H)  $\equiv$ 
  { $\langle x, \langle P(\text{fst}(\text{fst}(x)), \text{fst}(\text{snd}(x))) \rangle$  ,  $Q(\text{snd}(\text{fst}(x)), \text{snd}(\text{snd}(x))) \rangle \rangle$  .
   $x \in (G \times H) \times (G \times H)$ }
```

We define a context called `direct0` which holds an assumption that  $P, Q$  are binary operations on  $G, H$ , resp. and denotes  $R$  as the direct product of  $(G, P)$  and  $(H, Q)$ .

```
locale direct0 =
  fixes P Q G H
  assumes Pfun:  $P : G \times G \rightarrow G$ 
  assumes Qfun:  $Q : H \times H \rightarrow H$ 
  fixes R
  defines Rdef [simp]:  $R \equiv \text{DirectProduct}(P, Q, G, H)$ 
```

The direct product of binary operations is a binary operation.

**lemma** (in direct0) DirectProduct\_ZF\_1\_L1:

**shows**  $R : (G \times H) \times (G \times H) \rightarrow G \times H$

**proof** -

```
from Pfun Qfun have  $\forall x \in (G \times H) \times (G \times H).$ 
   $\langle P(\text{fst}(\text{fst}(x)), \text{fst}(\text{snd}(x))), Q(\text{snd}(\text{fst}(x)), \text{snd}(\text{snd}(x))) \rangle \in G \times H$ 
by auto
then show thesis using ZF_fun_from_total DirectProduct_def
by simp
```

**qed**

And it has the intended value.

**lemma** (in direct0) DirectProduct\_ZF\_1\_L2:

```
shows  $\forall x \in (G \times H). \forall y \in (G \times H).$ 
 $R\langle x, y \rangle = \langle P(\text{fst}(x), \text{fst}(y)), Q(\text{snd}(x), \text{snd}(y)) \rangle$ 
using DirectProduct_def DirectProduct_ZF_1_L1 ZF_fun_from_tot_val
```

by simp

And the value belongs to the set the operation is defined on.

```
lemma (in direct0) DirectProduct_ZF_1_L3:
  shows  $\forall x \in (G \times H). \forall y \in (G \times H). R\langle x, y \rangle \in G \times H$ 
  using DirectProduct_ZF_1_L1 by simp
```

### 33.2 Associative and commutative operations

If  $P$  and  $Q$  are both associative or commutative operations, the direct product of  $P$  and  $Q$  has the same property.

Direct product of commutative operations is commutative.

```
lemma (in direct0) DirectProduct_ZF_2_L1:
  assumes  $P \text{ \{is commutative on\} } G$  and  $Q \text{ \{is commutative on\} } H$ 
  shows  $R \text{ \{is commutative on\} } G \times H$ 
proof -
  from assms have  $\forall x \in (G \times H). \forall y \in (G \times H). R\langle x, y \rangle = R\langle y, x \rangle$ 
    using DirectProduct_ZF_1_L2 IsCommutative_def by simp
  then show thesis using IsCommutative_def by simp
qed
```

Direct product of associative operations is associative.

```
lemma (in direct0) DirectProduct_ZF_2_L2:
  assumes  $P \text{ \{is associative on\} } G$  and  $Q \text{ \{is associative on\} } H$ 
  shows  $R \text{ \{is associative on\} } G \times H$ 
proof -
  have  $\forall x \in G \times H. \forall y \in G \times H. \forall z \in G \times H. R\langle R\langle x, y \rangle, z \rangle =$ 
     $\langle P\langle P\langle \text{fst}(x), \text{fst}(y) \rangle, \text{fst}(z) \rangle, Q\langle Q\langle \text{snd}(x), \text{snd}(y) \rangle, \text{snd}(z) \rangle \rangle$ 
    using DirectProduct_ZF_1_L2 DirectProduct_ZF_1_L3
    by auto
  moreover have  $\forall x \in G \times H. \forall y \in G \times H. \forall z \in G \times H. R\langle x, R\langle y, z \rangle \rangle =$ 
     $\langle P\langle \text{fst}(x), P\langle \text{fst}(y), \text{fst}(z) \rangle \rangle, Q\langle \text{snd}(x), Q\langle \text{snd}(y), \text{snd}(z) \rangle \rangle \rangle$ 
    using DirectProduct_ZF_1_L2 DirectProduct_ZF_1_L3 by auto
  ultimately have  $\forall x \in G \times H. \forall y \in G \times H. \forall z \in G \times H. R\langle R\langle x, y \rangle, z \rangle = R\langle x, R\langle y, z \rangle \rangle$ 
    using assms IsAssociative_def by simp
  then show thesis
    using DirectProduct_ZF_1_L1 IsAssociative_def by simp
qed
end
```

## 34 OrderedGroup\_ZF.thy

**theory** OrderedGroup\_ZF **imports** Group\_ZF\_1 AbelianGroup\_ZF Order\_ZF Finite\_ZF\_1

**begin**

This theory file defines and shows the basic properties of (partially or linearly) ordered groups. We define the set of nonnegative elements and the absolute value function. We show that in linearly ordered groups finite sets are bounded and provide a sufficient condition for bounded sets to be finite. This allows to show in Int\_ZF\_IML.thy that subsets of integers are bounded iff they are finite.

### 34.1 Ordered groups

This section defines ordered groups and various related notions.

An ordered group is a group equipped with a partial order that is "translation invariant", that is if  $a \leq b$  then  $a \cdot g \leq b \cdot g$  and  $g \cdot a \leq g \cdot b$ .

**definition**

$$\begin{aligned} \text{IsAnOrdGroup}(G, P, r) \equiv & \\ & (\text{IsAGroup}(G, P) \wedge r \subseteq G \times G \wedge \text{IsPartOrder}(G, r) \wedge (\forall g \in G. \forall a \ b. \\ & \langle a, b \rangle \in r \longrightarrow \langle P\langle a, g \rangle, P\langle b, g \rangle \rangle \in r \wedge \langle P\langle g, a \rangle, P\langle g, b \rangle \rangle \in r) ) \end{aligned}$$

We define the set of nonnegative elements in the obvious way as  $G^+ = \{x \in G : 1 \leq x\}$ .

**definition**

$$\text{Nonnegative}(G, P, r) \equiv \{x \in G. \langle \text{TheNeutralElement}(G, P), x \rangle \in r\}$$

The  $\text{PositiveSet}(G, P, r)$  is a set similar to  $\text{Nonnegative}(G, P, r)$ , but without the unit.

**definition**

$$\begin{aligned} \text{PositiveSet}(G, P, r) \equiv & \\ \{x \in G. \langle \text{TheNeutralElement}(G, P), x \rangle \in r \wedge \text{TheNeutralElement}(G, P) \neq x\} & \end{aligned}$$

We also define the absolute value as a ZF-function that is the identity on  $G^+$  and the group inverse on the rest of the group.

**definition**

$$\begin{aligned} \text{AbsoluteValue}(G, P, r) \equiv & \text{id}(\text{Nonnegative}(G, P, r)) \cup \\ & \text{restrict}(\text{GroupInv}(G, P), G - \text{Nonnegative}(G, P, r)) \end{aligned}$$

The odd functions are defined as those having property  $f(a^{-1}) = (f(a))^{-1}$ . This looks a bit strange in the multiplicative notation, I have to admit. For linearly ordered groups a function  $f$  defined on the set of positive elements uniquely defines an odd function of the whole group. This function is called an odd extension of  $f$

**definition**

```

OddExtension(G,P,r,f) ≡
(f ∪ {⟨a, GroupInv(G,P)(f(GroupInv(G,P)(a)))⟩}.
a ∈ GroupInv(G,P)(PositiveSet(G,P,r))} ∪
{⟨TheNeutralElement(G,P),TheNeutralElement(G,P)⟩})

```

We will use a similar notation for ordered groups as for the generic groups.  $G^+$  denotes the set of nonnegative elements (that satisfy  $1 \leq a$ ) and  $G_+$  is the set of (strictly) positive elements.  $-A$  is the set inverses of elements from  $A$ . I hope that using additive notation for this notion is not too shocking here. The symbol  $f^\circ$  denotes the odd extension of  $f$ . For a function defined on  $G_+$  this is the unique odd function on  $G$  that is equal to  $f$  on  $G_+$ .

**locale group3 =**

### 34.3 The set of positive elements

In this section we study  $G_+$  - the set of elements that are (strictly) greater than the unit. The most important result is that every linearly ordered group can be decomposed into  $\{1\}$ ,  $G_+$  and the set of those elements  $a \in G$  such that  $a^{-1} \in G_+$ . Another property of linearly ordered groups that we prove here is that if  $G_+ \neq \emptyset$ , then it is infinite. This allows to show that nontrivial linearly ordered groups are infinite.

The positive set is closed under the group operation.

```

lemma (in group3) OrderedGroup_ZF_1_L13: shows  $G_+$  {is closed under}
P
proof -
  { fix a b assume a ∈  $G_+$  b ∈  $G_+$ 
    then have T1:  $1 \leq a \cdot b$  and  $1 \neq a \cdot b$

Nontrivial linearly ordered groups are infinite. Recall that  $\text{Fin}(A)$  is the collection of finite subsets of  $A$ . In this lemma we show that  $G \notin \text{Fin}(G)$ , that is that  $G$  is not a finite subset of itself. This is a way of saying that  $G$  is infinite. We also show that for nontrivial linearly ordered groups  $G_+$  is infinite.

begin

In this theory we continue the OrderedGroup\_ZF theory development.

### 35.1 Absolute value and the triangle inequality

The goal of this section is to prove the triangle inequality for ordered groups.

Absolute value maps  $G$  into  $G$ .

```
lemma (in group3) OrderedGroup_ZF_3_L1:
  shows AbsoluteValue(G,P,r) : G→G
proof -
  let f = id(G+)
  let g = restrict(GroupInv(G,P),G-G+)
  have f : G+→G+ using id_type by simp
  then have f : G+→G using OrderedGroup_ZF_1_L4E fun_weaken_type
    by blast
  moreover have g : G-G+→G
proof -
  from ordGroupAssum have GroupInv(G,P) : G→G
    using IsAnOrdGroup_def group0_2_T2 by simp
  moreover have G-G+ ⊆ G by auto
  ultimately show thesis using restrict_type2 by simp
qed
moreover have G+∩(G-G+) = 0 by blast
ultimately have f ∪ g : G+∪(G-G+)→G∪G
  by (rule fun_disjoint_Un)
moreover have G+∪(G-G+) = G using OrderedGroup_ZF_1_L4E
  by auto
ultimately show AbsoluteValue(G,P,r) : G→G
  using AbsoluteValue_def by simp
qed
```

If  $a \in G^+$ , then  $|a| = a$ .

```
lemma (in group3) OrderedGroup_ZF_3_L2:
  assumes A1: a∈G+ shows |a| = a
proof -
  from ordGroupAssum have GroupInv(G,P) : G→G
    using IsAnOrdGroup_def group0_2_T2 by simp
  with A1 show thesis using
    func1_1_L1 OrderedGroup_ZF_1_L4E fun_disjoint_apply1
    AbsoluteValue_def id_conv by simp
qed
```

The absolute value of the unit is the unit. In the additive totation that would be  $|0| = 0$ .

```
lemma (in group3) OrderedGroup_ZF_3_L2A:
  shows |1| = 1 using OrderedGroup_ZF_1_L3A OrderedGroup_ZF_3_L2
  by simp
```

If  $a$  is positive, then  $|a| = a$ .

```
lemma (in group3) OrderedGroup_ZF_3_L2B:

## 35.2 Maximum absolute value of a set

Quite often when considering inequalities we prefer to talk about the absolute values instead of raw elements of a set. This section formalizes some material that is useful for that.

If a set has a maximum and minimum, then the greater of the absolute value of the maximum and minimum belongs to the image of the set by the absolute value function.

```

lemma (in group3) OrderedGroup_ZF_4_L1:
  assumes A ⊆ G
  and HasAmaximum(r,A) HasAminimum(r,A)
  and M = GreaterOf(r, |Minimum(r,A)|, |Maximum(r,A)|)
  shows M ∈ AbsoluteValue(G,P,r)(A)
  using ordGroupAssum assms IsAnOrdGroup_def IsPartOrder_def
  Order_ZF_4_L3 Order_ZF_4_L4 OrderedGroup_ZF_3_L1
  func_imagedef GreaterOf_def by auto

```

If a set has a maximum and minimum, then the greater of the absolute value of the maximum and minimum bounds absolute values of all elements of the set.

```

lemma (in group3) OrderedGroup_ZF_4_L2:
  assumes A1: r {is total on} G
  and A2: HasAmaximum(r,A) HasAminimum(r,A)
  and A3: a ∈ A
  shows |a| ≤ GreaterOf(r, |Minimum(r,A)|, |Maximum(r,A)|)
proof -
  from ordGroupAssum A2 A3 have
    Minimum(r,A) ≤ a ≤ Maximum(r,A)

### 35.3 Alternative definitions

Sometimes it is useful to define the order by prescribing the set of positive or nonnegative elements. This section deals with two such definitions. One takes a subset  $H$  of  $G$  that is closed under the group operation,  $1 \notin H$  and for every  $a \in H$  we have either  $a \in H$  or  $a^{-1} \in H$ . Then the order is defined as  $a \leq b$  iff  $a = b$  or  $a^{-1}b \in H$ . For abelian groups this makes a linearly ordered group. We will refer to order defined this way in the comments as the order defined by a positive set. The context used in this section is the `group0` context defined in `Group_ZF` theory. Recall that `f` in that context denotes the group operation (unlike in the previous sections where the group operation was denoted `P`).

The order defined by a positive set is the same as the order defined by a nonnegative set.

```
lemma (in group0) OrderedGroup_ZF_5_L1:
  assumes A1:  $r = \{p \in G \times G. \text{fst}(p) = \text{snd}(p) \vee \text{fst}(p)^{-1} \cdot \text{snd}(p) \in H\}$

  with A4 T II have  $\langle b, a \rangle \in r$ 
  using Xor_def group0_2_L12 by simp
  } then have  $\langle a, b \rangle \in r \vee \langle b, a \rangle \in r$  by auto
  } then show r {is total on} G using IsTotal_def
  by simp
qed

```

If the set defined as in OrderedGroup\_ZF\_5\_L4 does not contain the neutral element, then it is the positive set for the resulting order.

```

lemma (in group0) OrderedGroup_ZF_5_L6:
  assumes P {is commutative on} G
  and  $H \subseteq G$  and  $1 \notin H$ 
  and  $r = \{p \in G \times G. \text{fst}(p) = \text{snd}(p) \vee \text{fst}(p)^{-1} \cdot \text{snd}(p) \in H\}$ 
  shows PositiveSet(G,P,r) = H
  using assms group_inv_of_one group0_2_L2 PositiveSet_def
  by auto

```

The next definition describes how we construct an order relation from the prescribed set of positive elements.

**definition**

```
OrderFromPosSet(G,P,H) ≡
  {p ∈ G×G. fst(p) = snd(p) ∨ P(GroupInv(G,P)(fst(p)),snd(p)) ∈ H }
```

The next theorem rephrases lemmas `OrderedGroup_ZF_5_L5` and `OrderedGroup_ZF_5_L6` using the definition of the order from the positive set `OrderFromPosSet`. To summarize, this is what it says: Suppose that  $H \subseteq G$  is a set closed under that group operation such that  $1 \notin H$  and for every nonunit group element  $a$  either  $a \in H$  or  $a^{-1} \in H$ . Define the order as  $a \leq b$  iff  $a = b$  or  $a^{-1} \cdot b \in H$ . Then this order makes  $G$  into a linearly ordered group such  $H$  is the set of positive elements (and then of course  $H \cup \{1\}$  is the set of nonnegative elements).

**theorem** (in `group0`) `Group_ord_by_positive_set`:

```
  assumes P {is commutative on} G
  and H⊆G   H {is closed under} P   1 ∉ H
  and ∀a∈G. a≠1 ⟶ (a∈H) Xor (a⁻¹∈H)
  shows
    IsAnOrdGroup(G,P,OrderFromPosSet(G,P,H))
    OrderFromPosSet(G,P,H) {is total on} G
    PositiveSet(G,P,OrderFromPosSet(G,P,H)) = H
    Nonnegative(G,P,OrderFromPosSet(G,P,H)) = H ∪ {1}
  using assms OrderFromPosSet_def OrderedGroup_ZF_5_L5 OrderedGroup_ZF_5_L6
  by auto
```

### 35.4 Odd Extensions

In this section we verify properties of odd extensions of functions defined on  $G_+$ . An odd extension of a function  $f : G_+ \rightarrow G$  is a function  $f^\circ : G \rightarrow G$  defined by  $f^\circ(x) = f(x)$  if  $x \in G_+$ ,  $f(1) = 1$  and  $f^\circ(x) = (f(x^{-1}))^{-1}$  for  $x < 1$ . Such function is the unique odd function that is equal to  $f$  when restricted to  $G_+$ .

The next lemma is just to see the definition of the odd extension in the notation used in the `group1` context.

**lemma** (in `group3`) `OrderedGroup_ZF_6_L1`:

```
  shows f° = f ∪ {⟨a, (f(a⁻¹))⁻¹⟩. a ∈ -G₊} ∪ {⟨1,1⟩}
  using OddExtension_def by simp
```

A technical lemma that states that from a function defined on  $G_+$  with values in  $G$  we have  $(f(a^{-1}))^{-1} \in G$ .

**lemma** (in `group3`) `OrderedGroup_ZF_6_L2`:

```
  assumes f: G₊→G and a∈-G₊
  shows
    f(a⁻¹) ∈ G
```

```

(f(a-1))-1 ∈ G
using assms OrderedGroup_ZF_1_L27 apply_funtype
OrderedGroup_ZF_1_L1 group0.inverse_in_group
by auto

```

The main theorem about odd extensions. It basically says that the odd extension of a function is what we want to to be.

```

lemma (in group3) odd_ext_props:
  assumes A1: r {is total on} G and A2: f: G+→G
  shows
    f° : G → G
    ∀a∈G+. (f°)(a) = f(a)
    ∀a∈(-G+). (f°)(a) = (f(a-1))-1
    (f°)(1) = 1
proof -
  from A1 A2 have I:
    f: G+→G
    ∀a∈-G+. (f(a-1))-1 ∈ G
    G+ ∩ (-G+) = 0
    1 ∉ G+ ∪ (-G+)
    f° = f ∪ {⟨a, (f(a-1))-1}. a ∈ -G+} ∪ {⟨1,1⟩}
    using OrderedGroup_ZF_6_L2 OrdGroup_decomp2 OrderedGroup_ZF_6_L1
    by auto
  then have f°: G+ ∪ (-G+) ∪ {1} → G ∪ G ∪ {1}
    by (rule func1_1_L11E)
  moreover from A1 have
    G+ ∪ (-G+) ∪ {1} = G
    G ∪ G ∪ {1} = G

    using OrderedGroup_ZF_1_L1 group0.group0_6_L2 by simp
  with A3 show  $((f^\circ)(a^{-1}))^{-1} = (f^\circ)(a)$  by simp
qed

```

### 35.5 Functions with infinite limits

In this section we consider functions  $f : G \rightarrow G$  with the property that for  $f(x)$  is arbitrarily large for large enough  $x$ . More precisely, for every  $a \in G$  there exist  $b \in G_+$  such that for every  $x \geq b$  we have  $f(x) \geq a$ . In a sense this means that  $\lim_{x \rightarrow \infty} f(x) = \infty$ , hence the title of this section. We also prove dual statements for functions such that  $\lim_{x \rightarrow -\infty} f(x) = -\infty$ .

If an image of a set by a function with infinite positive limit is bounded above, then the set itself is bounded above.

```

lemma (in group3) OrderedGroup_ZF_7_L1:
  assumes A1: r {is total on} G and A2:  $G \neq \{1\}$  and
  A3:  $f:G \rightarrow G$  and
  A4:  $\forall a \in G. \exists b \in G_+. \forall x. b \leq x \longrightarrow a \leq f(x)$  and
  A5:  $A \subseteq G$  and

## 36 Ring\_ZF.thy

```
theory Ring_ZF imports AbelianGroup_ZF
```

```
begin
```

This theory file covers basic facts about rings.

### 36.1 Definition and basic properties

In this section we define what is a ring and list the basic properties of rings.

We say that three sets  $(R, A, M)$  form a ring if  $(R, A)$  is an abelian group,  $(R, M)$  is a monoid and  $A$  is distributive with respect to  $M$  on  $R$ .  $A$  represents the additive operation on  $R$ . As such it is a subset of  $(R \times R) \times R$  (recall that in ZF set theory functions are sets). Similarly  $M$  represents the multiplicative operation on  $R$  and is also a subset of  $(R \times R) \times R$ . We don't require the multiplicative operation to be commutative in the definition of a ring.

**definition**

```
IsAring(R,A,M)  $\equiv$  IsAgroup(R,A)  $\wedge$  (A {is commutative on} R)  $\wedge$   
IsAmonoid(R,M)  $\wedge$  IsDistributive(R,A,M)
```

We also define the notion of having no zero divisors. In standard notation the ring has no zero divisors if for all  $a, b \in R$  we have  $a \cdot b = 0$  implies  $a = 0$  or  $b = 0$ .

**definition**

```
HasNoZeroDivs(R,A,M)  $\equiv$  ( $\forall a \in R. \forall b \in R.$   
M( $\langle a, b \rangle$ ) = TheNeutralElement(R,A)  $\longrightarrow$   
a = TheNeutralElement(R,A)  $\vee$  b = TheNeutralElement(R,A))
```

Next we define a locale that will be used when considering rings.

```
locale ring0 =
```

```
  fixes R and A and M
```

```
  assumes ringAssum: IsAring(R,A,M)
```

```
  fixes ringa (infixl + 90)
```

```
  defines ringa_def [simp]: a+b  $\equiv$  A( $\langle a, b \rangle$ )
```

```
  fixes ringminus (- _ 89)
```

```
  defines ringminus_def [simp]: (-a)  $\equiv$  GroupInv(R,A)(a)
```

```
  fixes ringsub (infixl - 90)
```

```
  defines ringsub_def [simp]: a-b  $\equiv$  a+(-b)
```

```

fixes ringm (infixl · 95)
defines ringm_def [simp]: a·b ≡ M⟨ a,b⟩

fixes ringzero (0)
defines ringzero_def [simp]: 0 ≡ TheNeutralElement(R,A)

fixes ringone (1)
defines ringone_def [simp]: 1 ≡ TheNeutralElement(R,M)

fixes ringtwo (2)

## 36.2 Rearrangement lemmas

It happens quite often that we want to show a fact like  $(a + b)c + d = (ac + d - e) + (bc + e)$  in rings. This is trivial in romantic math and probably there is a way to make it trivial in formalized math. However, I don't know any other way than to tediously prove each such rearrangement when it is needed. This section collects facts of this type.

Rearrangements with two elements of a ring.

**lemma** (in ring0) Ring\_ZF\_2\_L1: assumes  $a \in R$   $b \in R$

shows  $a + b \cdot a = (b + 1) \cdot a$

## 37 Ring\_ZF\_1.thy

**theory** Ring\_ZF\_1 **imports** Ring\_ZF Group\_ZF\_3

**begin**

This theory is devoted to the part of ring theory specific the construction of real numbers in the `Real_ZF_x` series of theories. The goal is to show that classes of almost homomorphisms form a ring.

### 37.1 The ring of classes of almost homomorphisms

Almost homomorphisms do not form a ring as the regular homomorphisms do because the lifted group operation is not distributive with respect to composition – we have  $s \circ (r \cdot q) \neq s \circ r \cdot s \circ q$  in general. However, we do have  $s \circ (r \cdot q) \approx s \circ r \cdot s \circ q$  in the sense of the equivalence relation defined by the group of finite range functions (that is a normal subgroup of almost homomorphisms, if the group is abelian). This allows to define a natural ring structure on the classes of almost homomorphisms.

The next lemma provides a formula useful for proving that two sides of the distributive law equation for almost homomorphisms are almost equal.

**lemma** (in group1) Ring\_ZF\_1\_1\_L1:  
**assumes** A1:  $s \in \text{AH}$   $r \in \text{AH}$   $q \in \text{AH}$  **and** A2:  $n \in G$   
**shows**  
 $((s \circ (r \cdot q))(n)) \cdot (((s \circ r) \cdot (s \circ q))(n))^{-1} = \delta(s, \langle r(n), q(n) \rangle)$   
 $((r \cdot q) \circ s)(n) = ((r \circ s) \cdot (q \circ s))(n)$   
**proof** -  
**from** groupAssum isAbelian A1 **have** T1:  
 $r \cdot q \in \text{AH}$   $s \circ r \in \text{AH}$   $s \circ q \in \text{AH}$   $(s \circ r) \cdot (s \circ q) \in \text{AH}$   
 $r \circ s \in \text{AH}$   $q \circ s \in \text{AH}$   $(r \circ s) \cdot (q \circ s) \in \text{AH}$

## 38 OrderedRing\_ZF.thy

**theory** OrderedRing\_ZF **imports** Ring\_ZF OrderedGroup\_ZF\_1

**begin**

In this theory file we consider ordered rings.

### 38.1 Definition and notation

This section defines ordered rings and sets up appropriate notation.

We define ordered ring as a commutative ring with linear order that is preserved by translations and such that the set of nonnegative elements is closed under multiplication. Note that this definition does not guarantee that there are no zero divisors in the ring.

**definition**

```
IsAnOrdRing(R,A,M,r)  $\equiv$   
( IsAring(R,A,M)  $\wedge$  (M {is commutative on} R)  $\wedge$   
r $\subseteq$ R $\times$ R  $\wedge$  IsLinOrder(R,r)  $\wedge$   
( $\forall$  a b.  $\forall$  c $\in$ R.  $\langle$  a,b $\rangle \in$  r  $\longrightarrow$   $\langle$  A $\langle$  a,c $\rangle$ ,A $\langle$  b,c $\rangle$  $\rangle \in$  r)  $\wedge$   
(Nonnegative(R,A,r) {is closed under} M))
```

The next context (locale) defines notation used for ordered rings. We do that by extending the notation defined in the ring0 locale and adding some assumptions to make sure we are talking about ordered rings in this context.

**locale** ring1 = ring0 +

```
assumes mult_commut: M {is commutative on} R
```

```
fixes r
```

```
assumes ordincl: r  $\subseteq$  R $\times$ R
```

```
assumes linord: IsLinOrder(R,r)
```

```
fixes lesseq (infix  $\leq$  68)
```

```
defines lesseq_def [simp]: a  $\leq$  b  $\equiv$   $\langle$  a,b $\rangle \in$  r
```

```
fixes sless (infix  $<$  68)
```

```
defines sless_def [simp]: a  $<$  b  $\equiv$  a $\leq$ b  $\wedge$  a $\neq$ b
```

```
assumes ordgroup:  $\forall$  a b.  $\forall$  c $\in$ R. a $\leq$ b  $\longrightarrow$  a+c  $\leq$  b+c
```

```
assumes pos_mult_closed: Nonnegative(R,A,r) {is closed under} M
```

```
fixes abs (| _ |)
```

```
defines abs_def [simp]: |a|  $\equiv$  AbsoluteValue(R,A,r)(a)
```

```

fixes positiveset (R+)
defines positiveset_def [simp]: R+ ≡ PositiveSet(R,A,r)

```

The next lemma assures us that we are talking about ordered rings in the ring1 context.

```

lemma (in ring1) OrdRing_ZF_1_L1: shows IsAnOrdRing(R,A,M,r)

## 38.2 Absolute value for ordered rings

Absolute value is defined for ordered groups as a function that is the identity on the nonnegative set and the negative of the element (the inverse in the multiplicative notation) on the rest. In this section we consider properties of absolute value related to multiplication in ordered rings.

Absolute value of a product is the product of absolute values: the case when both elements of the ring are nonnegative.

```

lemma (in ring1) OrdRing_ZF_2_L1:
  assumes  $0 \leq a$   $0 \leq b$ 
  shows  $|a \cdot b| = |a| \cdot |b|$ 
  using assms OrdRing_ZF_1_L5 OrdRing_ZF_1_L4
  group3.OrderedGroup_ZF_1_L2 group3.OrderedGroup_ZF_3_L2
  by simp

### 38.3 Positivity in ordered rings

This section is about properties of the set of positive elements  $R_+$ .

The set of positive elements is closed under ring addition. This is a property of ordered groups, we just reference a theorem from `OrderedGroup_ZF` theory in the proof.

```
lemma (in ring1) OrdRing_ZF_3_L1: shows  $R_+$  {is closed under} A
  using OrdRing_ZF_1_L4 group3.OrderedGroup_ZF_1_L13
  by simp
```

Every element of a ring can be either in the positive set, equal to zero or its opposite (the additive inverse) is in the positive set. This is a property of ordered groups, we just reference a theorem from `OrderedGroup_ZF` theory.

```
lemma (in ring1) OrdRing_ZF_3_L2: assumes  $a \in R$ 
  shows Exactly_1_of_3_holds ( $a=0$ ,  $a \in R_+$ ,  $(-a) \in R_+$ )
  using assms OrdRing_ZF_1_L4 group3.OrdGroup_decomp
  by simp
```

If a ring element  $a \neq 0$ , and it is not positive, then  $-a$  is positive.

```
lemma (in ring1) OrdRing_ZF_3_L2A: assumes  $a \in R$   $a \neq 0$   $a \notin R_+$ 
  shows  $(-a) \in R_+$ 
  using assms OrdRing_ZF_1_L4 group3.OrdGroup_cases
  by simp
```

$R_+$  is closed under multiplication iff the ring has no zero divisors.

```
lemma (in ring1) OrdRing_ZF_3_L3:
  shows  $(R_+ \text{ {is closed under} } M) \longleftrightarrow \text{HasNoZeroDivs}(R, A, M)$ 
proof

## 39 Cardinal\_ZF.thy

**theory** Cardinal\_ZF **imports** CardinalArith func1

**begin**

This theory file deals with results on cardinal numbers (cardinals). Cardinals are a generalization of the natural numbers, used to measure the cardinality (size) of sets. Contributed by Daniel de la Concepcion.

### 39.1 Some new ideas on cardinals

All the results of this section are done without assuming the Axiom of Choice. With the Axiom of Choice in play, the proofs become easier and some of the assumptions may be dropped.

Since General Topology Theory is closely related to Set Theory, it is very interesting to make use of all the possibilities of Set Theory to try to classify homeomorphic topological spaces. These ideas are generally used to prove that two topological spaces are not homeomorphic.

There exist cardinals which are the successor of another cardinal, but; as happens with ordinals, there are cardinals which are limit cardinal.

**definition**

$$\text{LimitC}(i) \equiv \text{Card}(i) \wedge 0 < i \wedge (\forall y. (y < i \wedge \text{Card}(y)) \longrightarrow \text{csucc}(y) < i)$$

Simple fact used a couple of times in proofs.

**lemma** nat\_less\_infty: **assumes**  $n \in \text{nat}$  **and**  $\text{InfCard}(X)$  **shows**  $n < X$

**proof** -

**from** assms **have**  $n < \text{nat}$  **and**  $\text{nat} \leq X$  **using** lt\_def InfCard\_def **by** auto  
  **then show**  $n < X$  **using** lt\_trans2 **by** blast

**qed**

There are three types of cardinals, the zero one, the successors of other cardinals and the limit cardinals.

**lemma** Card\_cases\_disj:

**assumes**  $\text{Card}(i)$

**shows**  $i = 0 \mid (\exists j. \text{Card}(j) \wedge i = \text{csucc}(j)) \mid \text{LimitC}(i)$

**proof**-

**from** assms **have**  $D: \text{Ord}(i)$  **using** Card\_is\_Ord **by** auto

  {

**assume**  $F: i \neq 0$

**assume**  $\text{Contr}: \sim \text{LimitC}(i)$

**from**  $F \ D$  **have**  $0 < i$  **using** Ord\_0\_lt **by** auto

**with**  $\text{Contr}$  **assms** **have**  $\exists y. y < i \wedge \text{Card}(y) \wedge \neg \text{csucc}(y) < i$

**using** LimitC\_def **by** blast

**then obtain**  $y$  **where**  $y < i \wedge \text{Card}(y) \wedge \neg \text{csucc}(y) < i$  **by** blast

**with**  $D$  **have**  $y < i \mid i \leq \text{csucc}(y)$  **and**  $0: \text{Card}(y)$

### 39.2 Main result on cardinals (without the *Axiom of Choice*)

If two sets are strictly injective to an infinite cardinal, then so is its union. For the case of successor cardinal, this theorem is done in the isabelle library in a more general setting; but that theorem is of not use in the case where  $\text{LimitC}(Q)$  and it also makes use of the Axiom of Choice. The mentioned theorem is in the theory file `Cardinal_AC.thy`

Note that if  $Q$  is finite and different from 1, let's assume  $Q = n$ , then the union of  $A$  and  $B$  is not bounded by  $Q$ . Counterexample: two disjoint sets of  $n - 1$  elements each have a union of  $2n - 2$  elements which are more than  $n$ .

Note also that if  $Q = 1$  then  $A$  and  $B$  must be empty and the union is then empty too; and  $Q$  cannot be 0 because no set is injective and not bijective to 0.

The proof is divided in two parts, first the case when both sets  $A$  and  $B$  are finite; and second, the part when at least one of them is infinite. In the first part, it is used the fact that a finite union of finite sets is finite. In the second part it is used the linear order on cardinals (ordinals). This proof can not be generalized to a setting with an infinite union easily.

### 39.3 Choice axioms

We want to prove some theorems assuming that some version of the Axiom of Choice holds. To avoid introducing it as an axiom we will define an appropriate predicate and put that in the assumptions of the theorems. That way technically we stay inside ZF.

The first predicate we define states that the axiom of  $Q$ -choice holds for subsets of  $K$  if we can find a choice function for every family of subsets of  $K$  whose (that family's) cardinality does not exceed  $Q$ .

#### definition

```

AxiomCardinalChoice ({the axiom of}_ {choice holds for subsets}_) where
  {the axiom of}  $Q$  {choice holds for subsets}  $K \equiv \text{Card}(Q) \wedge (\forall M N. (M \lesssim Q \wedge (\forall t \in M. Nt \neq 0 \wedge Nt \subseteq K)) \longrightarrow (\exists f. f: \Pi(M, \lambda t. Nt) \wedge (\forall t \in M. ft \in Nt)))$ 

```

Next we define a general form of  $Q$  choice where we don't require a collection of files to be included in a file.

#### definition

```

AxiomCardinalChoiceGen ({the axiom of}_ {choice holds}) where
  {the axiom of}  $Q$  {choice holds}  $\equiv \text{Card}(Q) \wedge (\forall M N. (M \lesssim Q \wedge (\forall t \in M. Nt \neq 0)) \longrightarrow (\exists f. f: \Pi(M, \lambda t. Nt) \wedge (\forall t \in M. ft \in Nt)))$ 

```

The axiom of finite choice always holds.

#### theorem finite\_choice:

## 40 Group\_ZF\_4.thy

```
theory Group_ZF_4 imports Group_ZF_1 Group_ZF_2 Finite_ZF Ring_ZF
  Cardinal_ZF Semigroup_ZF
```

```
begin
```

This theory file deals with normal subgroup test and some finite group theory. Then we define group homomorphisms and prove that the set of endomorphisms forms a ring with unity and we also prove the first isomorphism theorem.

### 40.1 Conjugation of subgroups

The conjugate of a subgroup is a subgroup.

```

Since the whole group and the trivial subgroup are normal, it is natural to define simplicity of groups in the following way:

**definition**

```

IsSimple ([_,_]{is a simple group} 89)
  where [G,f]{is a simple group} ≡ IsAgroup(G,f)^(∀M. IsAnormalSubgroup(G,f,M)
→ M=G∨M={TheNeutralElement(G,f)})

```

From the definition follows that if a group has no subgroups, then it is simple.

```

corollary (in group0) noSubgroup_imp_simple:
  assumes ∀H. IsAsubgroup(H,P)→ H=G∨H={1}
  shows [G,P]{is a simple group}
proof-
  have IsAgroup(G,P) using groupAssum. moreover
  {

## 40.4 Homomorphisms

A homomorphism is a function between groups that preserves group operations.

```

definition
  Homomor ( $\_ \{\text{is a homomorphism}\} \_ \rightarrow \_$  85)
  where  $\text{IsAgroup}(G, P) \implies \text{IsAgroup}(H, F) \implies \text{Homomor}(f, G, P, H, F) \equiv \forall g1 \in G. \forall g2 \in G. f(P\langle g1, g2 \rangle) = F\langle fg1, fg2 \rangle$ 

```

Now a lemma about the definition:

```

lemma homomor_eq:
  assumes  $\text{IsAgroup}(G, P) \text{ IsAgroup}(H, F) \text{ Homomor}(f, G, P, H, F)$   $g1 \in G \ g2 \in G$ 

```

```

shows f(P⟨g1,g2⟩)=F⟨fg1,fg2⟩
using assms Homomor_def by auto

```

An endomorphism is a homomorphism from a group to the same group. In case the group is abelian, it has a nice structure.

**definition**

```

End
where End(G,P) ≡ {f:G→G. Homomor(f,G,P,G,P)}

```

The set of endomorphisms forms a submonoid of the monoid of function from a set to that set under composition.

```

lemma(in group0) end_composition:
  assumes f1∈End(G,P) f2∈End(G,P)
  shows Composition(G)⟨f1,f2⟩∈End(G,P)

```

**proof-**

## 41 Field\_ZF.thy

```
theory Field_ZF imports Ring_ZF
```

```
begin
```

This theory covers basic facts about fields.

### 41.1 Definition and basic properties

In this section we define what is a field and list the basic properties of fields.

Field is a nontrivial commutative ring such that all non-zero elements have an inverse. We define the notion of being a field as a statement about three sets. The first set, denoted  $K$  is the carrier of the field. The second set, denoted  $A$  represents the additive operation on  $K$  (recall that in ZF set theory functions are sets). The third set  $M$  represents the multiplicative operation on  $K$ .

**definition**

```
IsAfield(K,A,M)  $\equiv$   
(IsAring(K,A,M)  $\wedge$  (M {is commutative on} K)  $\wedge$   
TheNeutralElement(K,A)  $\neq$  TheNeutralElement(K,M)  $\wedge$   
( $\forall a \in K. a \neq \text{TheNeutralElement}(K,A) \longrightarrow$   
( $\exists b \in K. M(a,b) = \text{TheNeutralElement}(K,M)$ )))
```

The `field0` context extends the `ring0` context adding field-related assumptions and notation related to the multiplicative inverse.

```
locale field0 = ring0 K A M for K A M +  
  assumes mult_commute: M {is commutative on} K  
  
  assumes not_triv: 0  $\neq$  1  
  
  assumes inv_exists:  $\forall a \in K. a \neq 0 \longrightarrow (\exists b \in K. a \cdot b = 1)$   
  
  fixes non_zero (K0)  
  defines non_zero_def[simp]: K0  $\equiv$  K - {0}  
  
  fixes inv (_-1 [96] 97)  
  defines inv_def[simp]: a-1  $\equiv$  GroupInv(K0, restrict(M, K0  $\times$  K0))(a)
```

The next lemma assures us that we are talking fields in the `field0` context.

```

### 41.3 1/0=0

In ZF if  $f : X \rightarrow Y$  and  $x \notin X$  we have  $f(x) = \emptyset$ . Since  $\emptyset$  (the empty set) in ZF is the same as zero of natural numbers we can claim that  $1/0 = 0$  in certain sense. In this section we prove a theorem that makes makes it explicit.

The next locale extends the `field0` locale to introduce notation for division operation.

```
locale fieldd = field0 +
  fixes division
  defines division_def[simp]: division ≡ {⟨p, fst(p)·snd(p)-1⟩. p∈K×K0}
```

```

fixes fdiv (infixl / 95)
defines fdiv_def[simp]: x/y  $\equiv$  division(x,y)

```

Division is a function on  $K \times K_0$  with values in  $K$ .

```

lemma (in fieldd) div_fun: shows division:  $K \times K_0 \rightarrow K$

qed
then have  $\{(p, \text{fst}(p) \cdot \text{snd}(p)^{-1}). p \in K \times K_0\}: K \times K_0 \rightarrow K$ 
  by (rule ZF_fun_from_total)
thus thesis by simp
qed

```

So, really  $1/0 = 0$ . The essential lemma is `apply_0` from standard Isabelle's `func.thy`.

```

theorem (in fieldd) one_over_zero: shows  $1/0 = 0$ 
proof-
  have  $\text{domain}(\text{division}) = K \times K_0$  using div_fun func1_1_L1
  by simp
  hence  $\langle 1, 0 \rangle \notin \text{domain}(\text{division})$  by auto
  then show thesis using apply_0 by simp
qed
end

```

## 42 OrderedField\_ZF.thy

```
theory OrderedField_ZF imports OrderedRing_ZF Field_ZF
```

```
begin
```

This theory covers basic facts about ordered fields.

### 42.1 Definition and basic properties

Here we define ordered fields and prove their basic properties.

Ordered field is a nontrivial ordered ring such that all non-zero elements have an inverse. We define the notion of being a ordered field as a statement about four sets. The first set, denoted  $K$  is the carrier of the field. The second set, denoted  $A$  represents the additive operation on  $K$  (recall that in ZF set theory functions are sets). The third set  $M$  represents the multiplicative operation on  $K$ . The fourth set  $r$  is the order relation on  $K$ .

**definition**

$$\begin{aligned} \text{IsAnOrdField}(K, A, M, r) \equiv & (\text{IsAnOrdRing}(K, A, M, r) \wedge \\ & (M \text{ \{is commutative on\} } K) \wedge \\ & \text{TheNeutralElement}(K, A) \neq \text{TheNeutralElement}(K, M) \wedge \\ & (\forall a \in K. a \neq \text{TheNeutralElement}(K, A) \longrightarrow \\ & (\exists b \in K. M(a, b) = \text{TheNeutralElement}(K, M)))) \end{aligned}$$

The next context (locale) defines notation used for ordered fields. We do that by extending the notation defined in the `ring1` context that is used for ordered rings and adding some assumptions to make sure we are talking about ordered fields in this context. We should rename the carrier from  $R$  used in the `ring1` context to  $K$ , more appropriate for fields. Theoretically the Isar locale facility supports such renaming, but we experienced difficulties using some lemmas from `ring1` locale after renaming.

```
locale field1 = ring1 +
```

```
  assumes mult_commute: M {is commutative on} R
```

```
  assumes not_triv: 0 ≠ 1
```

```
  assumes inv_exists: ∀ a ∈ R. a ≠ 0 ⟶ (∃ b ∈ R. a · b = 1)
```

```
  fixes non_zero (R0)
```

```
  defines non_zero_def[simp]: R0 ≡ R - {0}
```

```
  fixes inv (·-1 [96] 97)
```

```
  defines inv_def[simp]: a-1 ≡ GroupInv(R0, restrict(M, R0 × R0))(a)
```

The next lemma assures us that we are talking fields in the `field1` context.

```

### 42.3 Definition of real numbers

The only purpose of this section is to define what does it mean to be a model of real numbers.

We define model of real numbers as any quadruple of sets  $(K, A, M, r)$  such that  $(K, A, M, r)$  is an ordered field and the order relation  $r$  is complete, that is every set that is nonempty and bounded above in this relation has a supremum.

**definition**

`IsAmodelOfReals(K,A,M,r)  $\equiv$  IsAnOrdField(K,A,M,r)  $\wedge$  (r {is complete})`

**end**

## 43 Int\_ZF.thy

```
theory Int_ZF_IML imports OrderedGroup_ZF_1 Finite_ZF_1 Int_ZF Nat_ZF_IML
```

```
begin
```

This theory file is an interface between the old-style Isabelle (ZF logic) material on integers and the IsarMathLib project. Here we redefine the meta-level operations on integers (addition and multiplication) to convert them to ZF-functions and show that integers form a commutative group with respect to addition and commutative monoid with respect to multiplication. Similarly, we redefine the order on integers as a relation, that is a subset of  $Z \times Z$ . We show that a subset of integers is bounded iff it is finite. As we are forced to use standard Isabelle notation with all these dollar signs, sharps etc. to denote "type coercions" (?) the notation is often ugly and difficult to read.

### 43.1 Addition and multiplication as ZF-functions.

In this section we provide definitions of addition and multiplication as subsets of  $(Z \times Z) \times Z$ . We use the (higher order) relation defined in the standard `Int` theory to define a subset of  $Z \times Z$  that constitutes the ZF order relation corresponding to it. We define the set of positive integers using the notion of positive set from the `OrderedGroup_ZF` theory.

Definition of addition of integers as a binary operation on `int`. Recall that in standard Isabelle/ZF `int` is the set of integers and the sum of integers is denoted by prepending  $+$  with a dollar sign.

**definition**

$$\text{IntegerAddition} \equiv \{ \langle x, c \rangle \in (\text{int} \times \text{int}) \times \text{int}. \text{fst}(x) \$+ \text{snd}(x) = c \}$$

Definition of multiplication of integers as a binary operation on `int`. In standard Isabelle/ZF product of integers is denoted by prepending the dollar sign to  $\times$ .

**definition**

$$\begin{aligned} \text{IntegerMultiplication} \equiv \\ \{ \langle x, c \rangle \in (\text{int} \times \text{int}) \times \text{int}. \text{fst}(x) \$\times \text{snd}(x) = c \} \end{aligned}$$

Definition of natural order on integers as a relation on `int`. In the standard Isabelle/ZF the inequality relation on integers is denoted  $\leq$  prepended with the dollar sign.

**definition**

$$\text{IntegerOrder} \equiv \{ p \in \text{int} \times \text{int}. \text{fst}(p) \$\leq \text{snd}(p) \}$$

This defines the set of positive integers.

**definition**

```

PositiveIntegers  $\equiv$  PositiveSet(int,IntegerAddition,IntegerOrder)

IntegerAddition and IntegerMultiplication are functions on  $\text{int} \times \text{int}$ .

lemma Int_ZF_1_L1: shows
  IntegerAddition :  $\text{int} \times \text{int} \rightarrow \text{int}$ 
  IntegerMultiplication :  $\text{int} \times \text{int} \rightarrow \text{int}$

    IntegerMultiplication :  $\text{int} \times \text{int} \rightarrow \text{int}$ 
    using IntegerAddition_def IntegerMultiplication_def by auto
qed

```

The next context (locale) defines notation used for integers. We define **0** to denote the neutral element of addition, **1** as the unit of the multiplicative monoid. We introduce notation  $m \leq n$  for integers and write  $m..n$  to denote the integer interval with endpoints in  $m$  and  $n$ .  $\text{abs}(m)$  means the absolute value of  $m$ . This is a function defined in `OrderedGroup` that assigns  $x$  to itself if  $x$  is positive and assigns the opposite of  $x$  if  $x \leq 0$ . Unfortunately we cannot use the  $|\cdot|$  notation as in the `OrderedGroup` theory as this notation has been hogged by the standard Isabelle's `Int` theory. The notation  $-A$  where  $A$  is a subset of integers means the set  $\{-m : m \in A\}$ . The symbol  $\text{maxf}(f, M)$  denotes the maximum of function  $f$  over the set  $A$ . We also introduce a similar notation for the minimum.

qed

```

### 44.3 Integers as an ordered ring

We already know from Int\_ZF that integers with addition form a linearly ordered group. To show that integers form an ordered ring we need the fact that the set of nonnegative integers is closed under multiplication.

We start with the property that a product of nonnegative integers is nonnegative. The proof is by induction and the next lemma is the induction step.

```

lemma (in int0) Int_ZF_1_3_L1: assumes A1:  $0 \leq a$   $0 \leq b$ 
  and A3:  $0 \leq a \cdot b$ 
  shows  $0 \leq a \cdot (b+1)$ 
proof -

## 44.5 The set of nonnegative integers

The set of nonnegative integers looks like the set of natural numbers. We explore that in this section. We also rephrase some lemmas about the set of positive integers known from the theory of ordered groups.

The set of positive integers is closed under addition.

```
lemma (in int0) pos_int_closed_add:
  shows  $\mathbb{Z}_+$  {is closed under} IntegerAddition
  using Int_ZF_2_T1 group3.OrderedGroup_ZF_1_L13 by simp
```

Text expended version of the fact that the set of positive integers is closed under addition

```

lemma (in int0) pos_int_closed_add_unfolded:
  assumes a $\in\mathbb{Z}_+$  b $\in\mathbb{Z}_+$  shows a+b  $\in\mathbb{Z}_+$ 
  using assms pos_int_closed_add IsOpClosed_def
  by simp

```

$\mathbb{Z}^+$  is bounded below.

```

lemma (in int0) Int_ZF_1_5_L1: shows
  IsBoundedBelow( $\mathbb{Z}^+$ , IntegerOrder)
  IsBoundedBelow( $\mathbb{Z}_+$ , IntegerOrder)
  using Nonnegative_def PositiveSet_def IsBoundedBelow_def by auto

```

Subsets of  $\mathbb{Z}^+$  are bounded below.

```

lemma (in int0) Int_ZF_1_5_L1A: assumes A  $\subseteq\mathbb{Z}^+$ 
  shows IsBoundedBelow(A, IntegerOrder)
  using assms Int_ZF_1_5_L1 Order_ZF_3_L12 by blast

```

Subsets of  $\mathbb{Z}_+$  are bounded below.

```

lemma (in int0) Int_ZF_1_5_L1B: assumes A1: A  $\subseteq\mathbb{Z}_+$ 
  shows IsBoundedBelow(A, IntegerOrder)
  using A1 Int_ZF_1_5_L1 Order_ZF_3_L12 by blast

```

Every nonempty subset of positive integers has a minimum.

```

lemma (in int0) Int_ZF_1_5_L1C: assumes A  $\subseteq\mathbb{Z}_+$  and A  $\neq\emptyset$ 
  shows
    HasAminimum(IntegerOrder, A)
    Minimum(IntegerOrder, A)  $\in A$ 
     $\forall x\in A. \text{Minimum(IntegerOrder, A)} \leq x$ 
  using assms Int_ZF_1_5_L1B int_bounded_below_has_min by auto

```

Infinite subsets of  $\mathbb{Z}^+$  do not have a maximum - If  $A \subseteq \mathbb{Z}^+$  then for every integer we can find one in the set that is not smaller.

```

lemma (in int0) Int_ZF_1_5_L2:
  assumes A1: A  $\subseteq\mathbb{Z}^+$  and A2: A  $\notin \text{Fin}(\mathbb{Z})$  and A3: D $\in\mathbb{Z}$ 
  shows  $\exists n\in A. D\leq n$ 

```

**proof -**

```

{ assume  $\forall n\in A. \neg(D\leq n)$ 
  moreover from A1 A3 have D $\in\mathbb{Z}$   $\forall n\in A. n\in\mathbb{Z}$ 
    using Nonnegative_def by auto
  ultimately have  $\forall n\in A. n\leq D$ 
    using Int_ZF_2_L19 by blast
  hence  $\forall n\in A. \langle n, D \rangle \in \text{IntegerOrder}$  by simp
  then have IsBoundedAbove(A, IntegerOrder)
    by (rule Order_ZF_3_L10)
  with A1 have IsBounded(A, IntegerOrder)
    using Int_ZF_1_5_L1A IsBounded_def by simp
  with A2 have False using Int_bounded_iff_fin by auto
} thus thesis by auto

```

**qed**

Infinite subsets of  $\mathbb{Z}_+$  do not have a maximum - If  $A \subseteq \mathbb{Z}_+$  then for every integer we can find one in the set that is not smaller. This is very similar to Int\_ZF\_1\_5\_L2, except we have  $\mathbb{Z}_+$  instead of  $\mathbb{Z}^+$  here.

```

lemma (in int0) Int_ZF_1_5_L2A:
  assumes A1:  $A \subseteq \mathbb{Z}_+$  and A2:  $A \notin \text{Fin}(\mathbb{Z})$  and A3:  $D \in \mathbb{Z}$ 
  shows  $\exists n \in A. D \leq n$ 
proof -
{ assume  $\forall n \in A. \neg(D \leq n)$ 
  moreover from A1 A3 have  $D \in \mathbb{Z} \quad \forall n \in A. n \in \mathbb{Z}$ 
  using PositiveSet_def by auto
  ultimately have  $\forall n \in A. n \leq D$ 
  using Int_ZF_2_L19 by blast
  hence  $\forall n \in A. \langle n, D \rangle \in \text{IntegerOrder}$  by simp
  then have IsBoundedAbove(A, IntegerOrder)
    by (rule Order_ZF_3_L10)

  shows  $(-g(-a)) = g(a)$ 
  using assms Int_ZF_2_T1 group3.oddext_is_odd_alt by simp
```

## 44.6 Functions with infinite limits

In this section we consider functions (integer sequences) that have infinite limits. An integer function has infinite positive limit if it is arbitrarily large for large enough arguments. Similarly, a function has infinite negative limit if it is arbitrarily small for small enough arguments. The material in this come mostly from the section in `OrderedGroup_ZF.thy` with the same title. Here we rewrite the theorems from that section in the notation we use for integers and add some results specific for the ordered group of integers.

If an image of a set by a function with infinite positive limit is bounded above, then the set itself is bounded above.

```
lemma (in int0) Int_ZF_1_6_L1: assumes  $f: \mathbb{Z} \rightarrow \mathbb{Z}$  and
   $\forall a \in \mathbb{Z}. \exists b \in \mathbb{Z}_+. \forall x. b \leq x \longrightarrow a \leq f(x)$  and  $A \subseteq \mathbb{Z}$  and
   $\text{IsBoundedAbove}(f(A), \text{IntegerOrder})$ 
  shows  $\text{IsBoundedAbove}(A, \text{IntegerOrder})$ 
  using assms int_not_trivial Int_ZF_2_T1 group3.OrderedGroup_ZF_7_L1
  by simp
```

If an image of a set defined by separation by a function with infinite positive limit is bounded above, then the set itself is bounded above.

```
lemma (in int0) Int_ZF_1_6_L2: assumes A1:  $X \neq 0$  and A2:  $f: \mathbb{Z} \rightarrow \mathbb{Z}$  and
```

```
  A3:  $\forall a \in \mathbb{Z}. \exists b \in \mathbb{Z}_+. \forall x. b \leq x \longrightarrow a \leq f(x)$  and
  A4:  $\forall x \in X. b(x) \in \mathbb{Z} \wedge f(b(x)) \leq U$ 
  shows  $\exists u. \forall x \in X. b(x) \leq u$ 
```

**proof** -

```
  let  $G = \mathbb{Z}$ 
  let  $P = \text{IntegerAddition}$ 
  let  $r = \text{IntegerOrder}$ 
  from A1 A2 A3 A4 have
    group3( $G, P, r$ )
     $r \{ \text{is total on} \} G$ 
     $G \neq \{ \text{TheNeutralElement}(G, P) \}$ 
     $X \neq 0 \quad f: G \rightarrow G$ 
```

```

     $\forall a \in G. \exists b \in \text{PositiveSet}(G, P, r). \forall y. \langle b, y \rangle \in r \longrightarrow \langle a, f(y) \rangle \in r$ 
     $\forall x \in X. b(x) \in G \wedge \langle f(b(x)), U \rangle \in r$ 
    using int_not_trivial Int_ZF_2_T1 by auto
    then have  $\exists u. \forall x \in X. \langle b(x), u \rangle \in r$  by (rule group3.OrderedGroup_ZF_7_L2)
    thus thesis by simp
qed

```

If an image of a set defined by separation by a integer function with infinite negative limit is bounded below, then the set itself is bounded above. This is dual to Int\_ZF\_1\_6\_L2.

**lemma** (in int0) Int\_ZF\_1\_6\_L3: assumes A1:  $X \neq 0$  and A2:  $f: \mathbb{Z} \rightarrow \mathbb{Z}$  and

```

    A3:  $\forall a \in \mathbb{Z}. \exists b \in \mathbb{Z}_+. \forall y. b \leq y \longrightarrow f(-y) \leq a$  and
    A4:  $\forall x \in X. b(x) \in \mathbb{Z} \wedge L \leq f(b(x))$ 
    shows  $\exists 1. \forall x \in X. 1 \leq b(x)$ 

```

**proof** -

```

    let G =  $\mathbb{Z}$ 
    let P = IntegerAddition
    let r = IntegerOrder
    from A1 A2 A3 A4 have
      group3(G, P, r)
      r {is total on} G
       $G \neq \{\text{TheNeutralElement}(G, P)\}$ 
       $X \neq 0$  f:  $G \rightarrow G$ 
       $\forall a \in G. \exists b \in \text{PositiveSet}(G, P, r). \forall y. \langle b, y \rangle \in r \longrightarrow \langle f(\text{GroupInv}(G, P)(y)), a \rangle \in r$ 
       $\forall x \in X. b(x) \in G \wedge \langle L, f(b(x)) \rangle \in r$ 
      using int_not_trivial Int_ZF_2_T1 by auto
    then have  $\exists 1. \forall x \in X. \langle 1, b(x) \rangle \in r$  by (rule group3.OrderedGroup_ZF_7_L3)
    thus thesis by simp

```

qed

The next lemma combines Int\_ZF\_1\_6\_L2 and Int\_ZF\_1\_6\_L3 to show that if the image of a set defined by separation by a function with infinite limits is bounded, then the set itself is bounded. The proof again uses directly a fact from OrderedGroup\_ZF.

**lemma** (in int0) Int\_ZF\_1\_6\_L4:

```

    assumes A1:  $X \neq 0$  and A2:  $f: \mathbb{Z} \rightarrow \mathbb{Z}$  and
    A3:  $\forall a \in \mathbb{Z}. \exists b \in \mathbb{Z}_+. \forall x. b \leq x \longrightarrow a \leq f(x)$  and
    A4:  $\forall a \in \mathbb{Z}. \exists b \in \mathbb{Z}_+. \forall y. b \leq y \longrightarrow f(-y) \leq a$  and
    A5:  $\forall x \in X. b(x) \in \mathbb{Z} \wedge f(b(x)) \leq U \wedge L \leq f(b(x))$ 
    shows  $\exists M. \forall x \in X. \text{abs}(b(x)) \leq M$ 

```

**proof** -

```

    let G =  $\mathbb{Z}$ 
    let P = IntegerAddition
    let r = IntegerOrder
    from A1 A2 A3 A4 A5 have
      group3(G, P, r)

```

```

r {is total on} G
G ≠ {TheNeutralElement(G, P)}
X ≠ 0 f: G → G
∀ a ∈ G. ∃ b ∈ PositiveSet(G, P, r). ∀ y. ⟨b, y⟩ ∈ r → ⟨a, f(y)⟩ ∈ r

## 44.7 Miscellaneous

In this section we put some technical lemmas needed in various other places that are hard to classify.

Suppose we have an integer expression (a meta-function)  $F$  such that  $F(p)|p|$  is bounded by a linear function of  $|p|$ , that is for some integers  $A, B$  we have  $F(p)|p| \leq A|p| + B$ . We show that  $F$  is then bounded. The proof is easy, we just divide both sides by  $|p|$  and take the limit (just kidding).

```

lemma (in int0) Int_ZF_1_7_L1:
  assumes A1:  $\forall q \in \mathbb{Z}. F(q) \in \mathbb{Z}$  and
  A2:  $\forall q \in \mathbb{Z}. F(q) \cdot \text{abs}(q) \leq A \cdot \text{abs}(q) + B$  and

## 45 IntDiv\_ZF\_IML.thy

**theory** IntDiv\_ZF\_IML **imports** Int\_ZF\_1 IntDiv\_ZF

**begin**

This theory translates some results from the Isabelle's IntDiv.thy theory to the notation used by IsarMathLib.

### 45.1 Quotient and remainder

For any integers  $m, n$ ,  $n > 0$  there are unique integers  $q, p$  such that  $0 \leq p < n$  and  $m = n \cdot q + p$ . Number  $p$  in this decomposition is usually called  $m \bmod n$ . Standard Isabelle denotes numbers  $q, p$  as  $m \text{ zdiv } n$  and  $m \text{ zmod } n$ , resp., and we will use the same notation.

The next lemma is sometimes called the "quotient-remainder theorem".

**lemma** (in int0) IntDiv\_ZF\_1\_L1: **assumes**  $m \in \mathbb{Z}$   $n \in \mathbb{Z}$   
**shows**  $m = n \cdot (m \text{ zdiv } n) + (m \text{ zmod } n)$   
**using** assms Int\_ZF\_1\_L2 raw\_zmod\_zdiv\_equality  
**by** simp

If  $n$  is greater than 0 then  $m \text{ zmod } n$  is between 0 and  $n - 1$ .

**lemma** (in int0) IntDiv\_ZF\_1\_L2:  
**assumes** A1:  $m \in \mathbb{Z}$  **and** A2:  $0 \leq n$   $n \neq 0$   
**shows**  
 $0 \leq m \text{ zmod } n$   
 $m \text{ zmod } n \leq n$   $m \text{ zmod } n \neq n$   
 $m \text{ zmod } n \leq n-1$

## 46 Int\_ZF\_2.thy

`theory Int_ZF_2 imports func_ZF_1 Int_ZF_1 IntDiv_ZF_IML Group_ZF_3`

`begin`

In this theory file we consider the properties of integers that are needed for the real numbers construction in `Real_ZF` series.

### 46.1 Slopes

In this section we study basic properties of slopes - the integer almost homomorphisms. The general definition of an almost homomorphism  $f$  on a group  $G$  written in additive notation requires the set  $\{f(m+n) - f(m) - f(n) : m, n \in G\}$  to be finite. In this section we establish a definition that is equivalent for integers: that for all integer  $m, n$  we have  $|f(m+n) - f(m) - f(n)| \leq L$  for some  $L$ .

First we extend the standard notation for integers with notation related to slopes. We define slopes as almost homomorphisms on the additive group of integers. The set of slopes is denoted  $\mathcal{S}$ . We also define "positive" slopes as those that take infinite number of positive values on positive integers. We write  $\delta(s, m, n)$  to denote the homomorphism difference of  $s$  at  $m, n$  (i.e. the expression  $s(m+n) - s(m) - s(n)$ ). We denote  $\max \delta(s)$  the maximum absolute value of homomorphism difference of  $s$  as  $m, n$  range over integers. If  $s$  is a slope, then the set of homomorphism differences is finite and this maximum exists. In `Group_ZF_3` we define the equivalence relation on almost homomorphisms using the notion of a quotient group relation and use " $\approx$ " to denote it. As here this symbol seems to be hogged by the standard Isabelle, we will use " $\sim$ " instead " $\approx$ ". We show in this section that  $s \sim r$  iff for some  $L$  we have  $|s(m) - r(m)| \leq L$  for all integer  $m$ . The " $+$ " denotes the first operation on almost homomorphisms. For slopes this is addition of functions defined in the natural way. The " $\circ$ " symbol denotes the second operation on almost homomorphisms (see `Group_ZF_3` for definition), defined for the group of integers. In short " $\circ$ " is the composition of slopes. The " $^{-1}$ " symbol acts as an infix operator that assigns the value  $\min\{n \in \mathbb{Z}_+ : p \leq f(n)\}$  to a pair (of sets)  $f$  and  $p$ . In application  $f$  represents a function defined on  $\mathbb{Z}_+$  and  $p$  is a positive integer. We choose this notation because we use it to construct the right inverse in the ring of classes of slopes and show that this ring is in fact a field. To study the homomorphism difference of the function defined by  $p \mapsto f^{-1}(p)$  we introduce the symbol  $\varepsilon$  defined as  $\varepsilon(f, \langle m, n \rangle) = f^{-1}(m+n) - f^{-1}(m) - f^{-1}(n)$ . Of course the intention is to use the fact that  $\varepsilon(f, \langle m, n \rangle)$  is the homomorphism difference of the function  $g$  defined as  $g(m) = f^{-1}(m)$ . We also define  $\gamma(s, m, n)$  as the expression  $\delta(f, m, -n) + s(0) - \delta(f, n, -n)$ . This is useful because of the

identity  $f(m - n) = \gamma(m, n) + f(m) - f(n)$  that allows to obtain bounds on the value of a slope at the difference of two integers. For every integer  $m$  we introduce notation  $m^S$  defined by  $m^E(n) = m \cdot n$ . The mapping  $q \mapsto q^S$  embeds integers into  $\mathcal{S}$  preserving the order, (that is, maps positive integers into  $\mathcal{S}_+$ ).

In `Group_ZF_3.thy` we show that finite range functions valued in an abelian group form a normal subgroup of almost homomorphisms. This allows to define the equivalence relation between almost homomorphisms as the relation resulting from dividing by that normal subgroup. Then we show in `Group_ZF_3_4_L12` that if the difference of  $f$  and  $g$  has finite range (actually  $f(n) \cdot g(n)^{-1}$  as we use multiplicative notation in `Group_ZF_3.thy`), then  $f$  and  $g$  are equivalent. The next lemma translates that fact into the notation used in `int1` context.

## 46.2 Composing slopes

Composition of slopes is not commutative. However, as we show in this section if  $f$  and  $g$  are slopes then the range of  $f \circ g - g \circ f$  is bounded. This allows to show that the multiplication of real numbers is commutative.

Two useful estimates.

## 47 Int\_ZF\_3.thy

**theory** Int\_ZF\_3 **imports** Int\_ZF\_2

**begin**

This theory is a continuation of Int\_ZF\_2. We consider here the properties of slopes (almost homomorphisms on integers) that allow to define the order relation and multiplicative inverse on real numbers. We also prove theorems that allow to show completeness of the order relation of real numbers we define in Real\_ZF.

### 47.1 Positive slopes

This section provides background material for defining the order relation on real numbers.

Positive slopes are functions (of course.)

**lemma** (in int1) Int\_ZF\_2\_3\_L1: **assumes** A1:  $f \in \mathcal{S}_+$  **shows**  $f: \mathbb{Z} \rightarrow \mathbb{Z}$   
**using** assms AlmostHoms\_def PositiveSet\_def **by** simp

A small technical lemma to simplify the proof of the next theorem.

**lemma** (in int1) Int\_ZF\_2\_3\_L1A:  
**assumes** A1:  $f \in \mathcal{S}_+$  **and** A2:  $\exists n \in f(\mathbb{Z}_+) \cap \mathbb{Z}_+. a \leq n$   
**shows**  $\exists M \in \mathbb{Z}_+. a \leq f(M)$

**proof** -

**from** A1 **have**  $f: \mathbb{Z} \rightarrow \mathbb{Z} \quad \mathbb{Z}_+ \subseteq \mathbb{Z}$   
**using** AlmostHoms\_def PositiveSet\_def **by** auto  
**with** A2 **show** thesis **using** func\_imagedef **by** auto  
**qed**

The next lemma is Lemma 3 in the Arthan's paper.

**lemma** (in int1) Arthan\_Lem\_3:  
**assumes** A1:  $f \in \mathcal{S}_+$  **and** A2:  $D \in \mathbb{Z}_+$   
**shows**  $\exists M \in \mathbb{Z}_+. \forall m \in \mathbb{Z}_+. (m+1) \cdot D \leq f(m \cdot M)$

**proof** -

**let** E =  $\max \delta(f) + D$   
**let** A =  $f(\mathbb{Z}_+) \cap \mathbb{Z}_+$   
**from** A1 A2 **have** I:  $D \leq E$   
**using** Int\_ZF\_1\_5\_L3 Int\_ZF\_2\_1\_L8 Int\_ZF\_2\_L1A Int\_ZF\_2\_L15D  
**by** simp  
**from** A1 A2 **have**  $A \subseteq \mathbb{Z}_+ \quad A \not\subseteq \text{Fin}(\mathbb{Z}) \quad 2 \cdot E \in \mathbb{Z}$   
**using** int\_two\_three\_are\_int Int\_ZF\_2\_1\_L8 PositiveSet\_def Int\_ZF\_1\_1\_L5  
**by** auto  
**with** A1 **have**  $\exists M \in \mathbb{Z}_+. 2 \cdot E \leq f(M)$   
**using** Int\_ZF\_1\_5\_L2A Int\_ZF\_2\_3\_L1A **by** simp  
**then obtain** M **where** II:  $M \in \mathbb{Z}_+ \quad \text{and} \quad \text{III: } 2 \cdot E \leq f(M)$   
**by** auto

We know from Group\_ZF\_3.thy that finite range functions are almost homomorphisms. Besides reminding that fact for slopes the next lemma shows that finite range functions do not belong to  $S_+$ . This is important, because the projection of the set of finite range functions defines zero in the real

number construction in `Real_ZF_x.thy` series, while the projection of  $S_+$  becomes the set of (strictly) positive reals. We don't want zero to be positive, do we? The next lemma is a part of Lemma 5 in the Arthan's paper [2].

```
lemma (in int1) Int_ZF_2_3_L1B:
  assumes A1:  $f \in \text{FinRangeFunctions}(\mathbb{Z}, \mathbb{Z})$ 
  shows  $f \in S \quad f \notin S_+$ 
proof -
  from A1 show  $f \in S$  using Int_ZF_2_1_L1 group1.Group_ZF_3_3_L1
  by auto
  have  $\mathbb{Z}_+ \subseteq \mathbb{Z}$  using PositiveSet_def by auto

## 47.2 Inverting slopes

Not every slope is a 1:1 function. However, we can still invert slopes in the sense that if  $f$  is a slope, then we can find a slope  $g$  such that  $f \circ g$  is almost equal to the identity function. The goal of this section is to establish this fact for positive slopes.

If  $f$  is a positive slope, then for every positive integer  $p$  the set  $\{n \in \mathbb{Z}_+ : p \leq f(n)\}$  is a nonempty subset of positive integers. Recall that  $f^{-1}(p)$  is the notation for the smallest element of this set.

```

lemma (in int1) Int_ZF_2_4_L1:
  assumes A1:  $f \in S_+$  and A2:  $p \in \mathbb{Z}_+$  and A3:  $A = \{n \in \mathbb{Z}_+ . p \leq f(n)\}$ 
  shows
     $A \subseteq \mathbb{Z}_+$

```

The expression  $f^{-1}(m+n) - f^{-1}(m) - f^{-1}(n)$  is uniformly bounded for all pairs  $\langle m, n \rangle \in \mathbb{Z}_+ \times \mathbb{Z}_+$ . Recall that in the `int1` context  $\varepsilon(f, x)$  is defined so that  $\varepsilon(f, \langle m, n \rangle) = f^{-1}(m+n) - f^{-1}(m) - f^{-1}(n)$ .

**lemma** (in `int1`) `Int_ZF_2_4_L8`: assumes `A1`:  $f \in \mathcal{S}_+$  and  
`A2`:  $\forall m \in \mathbb{Z}_+. f^{-1}(m)-1 \in \mathbb{Z}_+$   
 shows  $\exists M. \forall x \in \mathbb{Z}_+ \times \mathbb{Z}_+. \text{abs}(\varepsilon(f, x)) \leq M$

**proof** -

Int\_ZF\_2\_4\_L12 is almost what we need, except that it has an assumption that the values of the slope that we get the inverse for are not smaller than 2 on positive integers. The Arthan's proof of Theorem 11 has a mistake where he says "note that for all but finitely many  $m, n \in N$   $p = g(m)$  and  $q = g(n)$  are both positive". Of course there may be infinitely many pairs  $\langle m, n \rangle$  such that  $p, q$  are not both positive. This is however easy to workaround: we just modify the slope by adding a constant so that the slope is large enough on positive integers and then look for the inverse.

### 47.3 Completeness

In this section we consider properties of slopes that are needed for the proof of completeness of real numbers constructed in `Real_ZF_1.thy`. In particular we consider properties of embedding of integers into the set of slopes by the mapping  $m \mapsto m^S$ , where  $m^S$  is defined by  $m^S(n) = m \cdot n$ .

If  $m$  is an integer, then  $m^S$  is a slope whose value is  $m \cdot n$  for every integer.

**lemma** (in `int1`) `Int_ZF_2_5_L1`: assumes  $A1: m \in \mathbb{Z}$

shows

$\forall n \in \mathbb{Z}. (m^S)(n) = m \cdot n$

$m^S \in S$

**proof** -

from  $A1$  have  $I: m^S: \mathbb{Z} \rightarrow \mathbb{Z}$

using `Int_ZF_1_1_L5` `ZF_fun_from_total` by simp

then show  $II: \forall n \in \mathbb{Z}. (m^S)(n) = m \cdot n$  using `ZF_fun_from_tot_val`

by simp

{ fix  $n$   $k$

assume  $A2: n \in \mathbb{Z} \quad k \in \mathbb{Z}$

with  $A1$  have  $T: m \cdot n \in \mathbb{Z} \quad m \cdot k \in \mathbb{Z}$

using `Int_ZF_1_1_L5` by auto

```

from A1 A2 II T have  $\delta(m^S, n, k) = m \cdot k - m \cdot k$ 
  using Int_ZF_1_1_L5 Int_ZF_1_1_L1 Int_ZF_1_2_L3
  by simp
also from T have ... = 0 using Int_ZF_1_1_L4
  by simp
finally have  $\delta(m^S, n, k) = 0$  by simp
then have  $\text{abs}(\delta(m^S, n, k)) \leq 0$ 
  using Int_ZF_2_L18 int_zero_one_are_int int_ord_is_refl refl_def
  by simp
} then have  $\forall n \in \mathbb{Z}. \forall k \in \mathbb{Z}. \text{abs}(\delta(m^S, n, k)) \leq 0$ 
  by simp
with I show  $m^S \in \mathcal{S}$  by (rule Int_ZF_2_1_L5)
qed

```

For any slope  $f$  there is an integer  $m$  such that there is some slope  $g$  that is almost equal to  $m^S$  and dominates  $f$  in the sense that  $f \leq g$  on positive integers (which implies that either  $g$  is almost equal to  $f$  or  $g - f$  is a positive slope. This will be used in `Real_ZF_1.thy` to show that for any real number there is an integer that (whose real embedding) is greater or equal.

**lemma** (in int1) Int\_ZF\_2\_5\_L2: **assumes** A1:  $f \in \mathcal{S}$   
**shows**  $\exists m \in \mathbb{Z}. \exists g \in \mathcal{S}. (m^S \sim g \wedge (f \sim g \vee g + (-f) \in \mathcal{S}_+))$

**proof** -

from A1 have

## 48 Real\_ZF.thy

**theory** Real\_ZF **imports** Int\_ZF\_IML Ring\_ZF\_1

**begin**

The goal of the `Real_ZF` series of theory files is to provide a construction of the set of real numbers. There are several ways to construct real numbers. Most common start from the rational numbers and use Dedekind cuts or Cauchy sequences. `Real_ZF_x.thy` series formalizes an alternative approach that constructs real numbers directly from the group of integers. Our formalization is mostly based on [2]. Different variants of this construction are also described in [1] and [3]. I recommend to read these papers, but for the impatient here is a short description: we take a set of maps  $s : \mathbb{Z} \rightarrow \mathbb{Z}$  such that the set  $\{s(m+n) - s(m) - s(n)\}_{n,m \in \mathbb{Z}}$  is finite ( $\mathbb{Z}$  means the integers here). We call these maps slopes. Slopes form a group with the natural addition  $(s+r)(n) = s(n) + r(n)$ . The maps such that the set  $s(\mathbb{Z})$  is finite (finite range functions) form a subgroup of slopes. The additive group of real numbers is defined as the quotient group of slopes by the (sub)group of finite range functions. The multiplication is defined as the projection of the composition of slopes into the resulting quotient (coset) space.

### 48.1 The definition of real numbers

This section contains the construction of the ring of real numbers as classes of slopes - integer almost homomorphisms. The real definitions are in `Group_ZF_2` theory, here we just specialize the definitions of almost homomorphisms, their equivalence and operations to the additive group of integers from the general case of abelian groups considered in `Group_ZF_2`.

The set of slopes is defined as the set of almost homomorphisms on the additive group of integers.

**definition**

`Slopes`  $\equiv$  `AlmostHoms(int,IntegerAddition)`

The first operation on slopes (pointwise addition) is a special case of the first operation on almost homomorphisms.

**definition**

`SlopeOp1`  $\equiv$  `AlHomOp1(int,IntegerAddition)`

The second operation on slopes (composition) is a special case of the second operation on almost homomorphisms.

**definition**

`SlopeOp2`  $\equiv$  `AlHomOp2(int,IntegerAddition)`

Bounded integer maps are functions from integers to integers that have finite range. They play a role of zero in the set of real numbers we are constructing.

**definition**

```
BoundedIntMaps ≡ FinRangeFunctions(int,int)
```

Bounded integer maps form a normal subgroup of slopes. The equivalence relation on slopes is the (group) quotient relation defined by this subgroup.

**definition**

```
SlopeEquivalenceRel ≡ QuotientGroupRel(Slopes,SlopeOp1,BoundedIntMaps)
```

The set of real numbers is the set of equivalence classes of slopes.

**definition**

```
RealNumbers ≡ Slopes//SlopeEquivalenceRel
```

The addition on real numbers is defined as the projection of pointwise addition of slopes on the quotient. This means that the additive group of real numbers is the quotient group: the group of slopes (with pointwise addition) defined by the normal subgroup of bounded integer maps.

**definition**

```
RealAddition ≡ ProjFun2(Slopes,SlopeEquivalenceRel,SlopeOp1)
```

Multiplication is defined as the projection of composition of slopes on the quotient. The fact that it works is probably the most surprising part of the construction.

**definition**

```
RealMultiplication ≡ ProjFun2(Slopes,SlopeEquivalenceRel,SlopeOp2)
```

We first show that we can use theorems proven in some proof contexts (locales). The locale `group1` requires assumption that we deal with an abelian group. The next lemma allows to use all theorems proven in the context called `group1`.

**lemma** `Real_ZF_1_L1: shows group1(int,IntegerAddition)`

```
using group1_axioms.intro group1_def Int_ZF_1_T2 by simp
```

Real numbers form a ring. This is a special case of the theorem proven in `Ring_ZF_1.thy`, where we show the same in general for almost homomorphisms rather than slopes.

**theorem** `Real_ZF_1_T1: shows IsAring(RealNumbers,RealAddition,RealMultiplication)`

**proof** -

```
let AH = AlmostHoms(int,IntegerAddition)
let Op1 = AlHomOp1(int,IntegerAddition)
let FR = FinRangeFunctions(int,int)
let Op2 = AlHomOp2(int,IntegerAddition)
let R = QuotientGroupRel(AH,Op1,FR)
let A = ProjFun2(AH,R,Op1)
let M = ProjFun2(AH,R,Op2)
```

```

We will need a couple of results from Group\_ZF\_3.thy The first two that state that the definition of addition and multiplication of real numbers are consistent, that is the result does not depend on the choice of the slopes representing the numbers. The second one implies that what we call SlopeEquivalenceRel is actually an equivalence relation on the set of slopes. We also show that the neutral element of the multiplicative operation on reals (in short number 1) is the class of the identity function on integers.

Identity function on integers is a slope. This lemma concludes the easy part of the construction that follows from the fact that slope equivalence classes form a ring. It is easy to see that multiplication of classes of almost homomorphisms is not commutative in general. The remaining properties of real numbers, like commutativity of multiplication and the existence of multiplicative inverses have to be proven using properties of the group of integers, rather than in general setting of abelian groups.

## 49 Real\_ZF\_1.thy

**theory** Real\_ZF\_1 **imports** Real\_ZF Int\_ZF\_3 OrderedField\_ZF

**begin**

In this theory file we continue the construction of real numbers started in Real\_ZF to a succesful conclusion. We put here those parts of the construction that can not be done in the general settings of abelian groups and require integers.

### 49.1 Definitions and notation

In this section we define notions and notation needed for the rest of the construction.

We define positive slopes as those that take an infinite number of positive values on the positive integers (see Int\_ZF\_2 for properties of positive slopes).

**definition**

$\text{PositiveSlopes} \equiv \{s \in \text{Slopes}.$   
 $s(\text{PositiveIntegers}) \cap \text{PositiveIntegers} \notin \text{Fin}(\text{int})\}$

The order on the set of real numbers is constructed by specifying the set of positive reals. This set is defined as the projection of the set of positive slopes.

**definition**

$\text{PositiveReals} \equiv \{\text{SlopeEquivalenceRel}\{s\}. s \in \text{PositiveSlopes}\}$

The order relation on real numbers is constructed from the set of positive elements in a standard way (see section "Alternative definitions" in OrderedGroup\_ZF.)

**definition**

$\text{OrderOnReals} \equiv \text{OrderFromPosSet}(\text{RealNumbers}, \text{RealAddition}, \text{PositiveReals})$

The next locale extends the locale `real0` to define notation specific to the construction of real numbers. The notation follows the one defined in Int\_ZF\_2.thy. If  $m$  is an integer, then the real number which is the class of the slope  $n \mapsto m \cdot n$  is denoted  $m^R$ . For a real number  $a$  notation  $\lfloor a \rfloor$  means the largest integer  $m$  such that the real version of it (that is,  $m^R$ ) is not greater than  $a$ . For an integer  $m$  and a subset of reals  $S$  the expression  $\Gamma(S, m)$  is defined as  $\max\{\lfloor p^R \cdot x \rfloor : x \in S\}$ . This plays a role in the proof of completeness of real numbers. We also reuse some notation defined in the `int0` context, like  $\mathbb{Z}_+$  (the set of positive integers) and  $\text{abs}(m)$  (the absolute value of an integer, and some defined in the `int1` context, like the addition  $(+)$  and composition  $(\circ)$  of slopes.

## 49.2 Multiplication of real numbers

Multiplication of real numbers is defined as a projection of composition of slopes onto the space of equivalence classes of slopes. Thus, the product of the real numbers given as classes of slopes  $s$  and  $r$  is defined as the class of  $s \circ r$ . The goal of this section is to show that multiplication defined this way is commutative.

Let's recall a theorem from `Int_ZF_2.thy` that states that if  $f, g$  are slopes, then  $f \circ g$  is equivalent to  $g \circ f$ . Here we conclude from that that the classes of  $f \circ g$  and  $g \circ f$  are the same.

```

lemma (in real1) Real_ZF_1_1_L2: assumes A1:  $f \in \mathcal{S}$   $g \in \mathcal{S}$ 
  shows  $[f \circ g] = [g \circ f]$ 
proof -
  from A1 have  $f \circ g \sim g \circ f$ 
    using Slopes_def int1.Arthan_Th_9 SlopeOp1_def BoundedIntMaps_def
    SlopeEquivalenceRel_def SlopeOp2_def by simp
  then show thesis using Real_ZF_1_L11 equiv_class_eq

```

by simp  
qed

Classes of slopes are real numbers.

```
lemma (in real1) Real_ZF_1_1_L3: assumes A1:  $f \in \mathcal{S}$ 
  shows  $[f] \in \mathbb{R}$ 
proof -
  from A1 have  $[f] \in \text{Slopes} // \text{SlopeEquivalenceRel}$ 
    using Slopes_def quotientI by simp
  then show  $[f] \in \mathbb{R}$  using RealNumbers_def by simp
qed
```

Each real number is a class of a slope.

```
lemma (in real1) Real_ZF_1_1_L3A: assumes A1:  $a \in \mathbb{R}$ 
  shows  $\exists f \in \mathcal{S} . a = [f]$ 
proof -
  from A1 have  $a \in \mathcal{S} // \text{SlopeEquivalenceRel}$ 
    using RealNumbers_def Slopes_def by simp
  then show thesis using quotient_def
    by simp
qed
```

It is useful to have the definition of addition and multiplication in the `real1` context notation.

```
lemma (in real1) Real_ZF_1_1_L4:
  assumes A1:  $f \in \mathcal{S} \quad g \in \mathcal{S}$ 
  shows
     $[f] + [g] = [f+g]$ 
     $[f] \cdot [g] = [f \circ g]$ 
proof -
  let r = SlopeEquivalenceRel
  have  $[f] \cdot [g] = \text{ProjFun2}(\mathcal{S}, r, \text{SlopeOp2}) \langle [f], [g] \rangle$ 
    using RealMultiplication_def Slopes_def by simp
  also from A1 have  $\dots = [f \circ g]$ 
    using Real_ZF_1_L11 EquivClass_1_L10 Slopes_def
    by simp
  finally show  $[f] \cdot [g] = [f \circ g]$  by simp
  have  $[f] + [g] = \text{ProjFun2}(\mathcal{S}, r, \text{SlopeOp1}) \langle [f], [g] \rangle$ 
    using RealAddition_def Slopes_def by simp
  also from A1 have  $\dots = [f+g]$ 
    using Real_ZF_1_L11 EquivClass_1_L10 Slopes_def
    by simp
  finally show  $[f] + [g] = [f+g]$  by simp
qed
```

The next lemma is essentially the same as `Real_ZF_1_L12`, but written in the notation defined in the `real1` context. It states that if  $f$  is a slope, then  $-[f] = [-f]$ .

```

lemma (in real1) Real_ZF_1_1_L4A: assumes  $f \in \mathcal{S}$ 
  shows  $[-f] = -[f]$ 
  using assms Slopes_def SlopeEquivalenceRel_def Real_ZF_1_L12

It is convenient to have the transitivity of the order on integers in the notation specific to `real1` context. This may be confusing for the presentation readers: even though  $\leq$  and  $\leq$  are printed in the same way, they are different symbols in the source. In the `real1` context the former denotes inequality between integers, and the latter denotes inequality between real numbers (classes of slopes). The next lemma is about transitivity of the order relation on integers.

```

lemma (in real1) int_order_transitive:
  assumes A1:  $a \leq b$   $b \leq c$

#### 49.4 Inverting reals

In this section we tackle the issue of existence of (multiplicative) inverses of real numbers and show that real numbers form an ordered field. We also restate here some facts specific to ordered fields that we need for the construction. The actual proofs of most of these facts can be found in `Field_ZF.thy` and `OrderedField_ZF.thy`

We rewrite the theorem from `Int_ZF_2.thy` that shows that for every positive slope we can find one that is almost equal and has an inverse.

```

lemma (in real1) pos_slopes_have_inv: assumes  $f \in \mathcal{S}_+$ 
  shows  $\exists g \in \mathcal{S}. f \sim g \wedge (\exists h \in \mathcal{S}. g \circ h \sim \text{id}(\text{int}))$

The next lemma provides sufficient condition for an odd function to be an almost homomorphism. It says for odd functions we only need to check that the homomorphism difference (denoted  $\delta$  in the `real1` context) is bounded on positive integers. This is really proven in `Int_ZF_2.thy`, but we restate it here for convenience. Recall from `Group_ZF_3.thy` that `OddExtension` of a function defined on the set of positive elements (of an ordered group) is the only odd function that is equal to the given one when restricted to positive elements.

## 50 Complex\_ZF.thy

**theory** Complex\_ZF **imports** func\_ZF\_1 OrderedField\_ZF

**begin**

The goal of this theory is to define complex numbers and prove that the Metamath complex numbers axioms hold.

### 50.1 From complete ordered fields to complex numbers

This section consists mostly of definitions and a proof context for talking about complex numbers. Suppose we have a set  $R$  with binary operations  $A$  and  $M$  and a relation  $r$  such that the quadruple  $(R, A, M, r)$  forms a complete ordered field. The next definitions take  $(R, A, M, r)$  and construct the sets that represent the structure of complex numbers: the carrier ( $\mathbb{C} = R \times R$ ), binary operations of addition and multiplication of complex numbers and the order relation on  $\mathbb{R} = R \times 0$ . The `ImCxAdd`, `ReCxAdd`, `ImCxMul`, `ReCxMul` are helper meta-functions representing the imaginary part of a sum of complex numbers, the real part of a sum of real numbers, the imaginary part of a product of complex numbers and the real part of a product of real numbers, respectively. The actual operations (subsets of  $(R \times R) \times R$  are named `CplxAdd` and `CplxMul`.

When  $R$  is an ordered field, it comes with an order relation. This induces a natural strict order relation on  $\{\langle x, 0 \rangle : x \in R\} \subseteq R \times R$ . We call the set  $\{\langle x, 0 \rangle : x \in R\}$  `ComplexReals(R,A)` and the strict order relation `CplxROrder(R,A,r)`. The order on the real axis of complex numbers is defined as the relation induced on it by the canonical projection on the first coordinate and the order we have on the real numbers. OK, lets repeat this slower. We start with the order relation  $r$  on a (model of) real numbers  $R$ . We want to define an order relation on a subset of complex numbers, namely on  $R \times \{0\}$ . To do that we use the notion of a relation induced by a mapping. The mapping here is  $f : R \times \{0\} \rightarrow R, f\langle x, 0 \rangle = x$  which is defined under a name of `SliceProjection` in `func_ZF.thy`. This defines a relation  $r_1$  (called `InducedRelation(f,r)`, see `func_ZF`) on  $R \times \{0\}$  such that  $\langle \langle x, 0 \rangle, \langle y, 0 \rangle \in r_1$  iff  $\langle x, y \rangle \in r$ . This way we get what we call `CplxROrder(R,A,r)`. However, this is not the end of the story, because Metamath uses strict inequalities in its axioms, rather than weak ones like `IsarMathLib` (mostly). So we need to take the strict version of this order relation. This is done in the syntax definition of  $<_{\mathbb{R}}$  in the definition of `complex0` context. Since Metamath proves a lot of theorems about the real numbers extended with  $+\infty$  and  $-\infty$ , we define the notation for inequalities on the extended real line as well.

A helper expression representing the real part of the sum of two complex numbers.

**definition**

$$\text{ReCxAdd}(R, A, a, b) \equiv A(\text{fst}(a), \text{fst}(b))$$

An expression representing the imaginary part of the sum of two complex numbers.

**definition**

$$\text{ImCxAdd}(R, A, a, b) \equiv A(\text{snd}(a), \text{snd}(b))$$

The set (function) that is the binary operation that adds complex numbers.

**definition**

$$\begin{aligned} \text{CplxAdd}(R, A) \equiv \\ \{ \langle p, \langle \text{ReCxAdd}(R, A, \text{fst}(p), \text{snd}(p)), \text{ImCxAdd}(R, A, \text{fst}(p), \text{snd}(p)) \rangle \rangle \mid \\ p \in (R \times R) \times (R \times R) \} \end{aligned}$$

The expression representing the imaginary part of the product of complex numbers.

**definition**

$$\text{ImCxMul}(R, A, M, a, b) \equiv A(M(\text{fst}(a), \text{snd}(b)), M(\text{snd}(a), \text{fst}(b)))$$

The expression representing the real part of the product of complex numbers.

**definition**

$$\begin{aligned} \text{ReCxMul}(R, A, M, a, b) \equiv \\ A(M(\text{fst}(a), \text{fst}(b)), \text{GroupInv}(R, A)(M(\text{snd}(a), \text{snd}(b)))) \end{aligned}$$

The function (set) that represents the binary operation of multiplication of complex numbers.

**definition**

$$\begin{aligned} \text{CplxMul}(R, A, M) \equiv \\ \{ \langle p, \langle \text{ReCxMul}(R, A, M, \text{fst}(p), \text{snd}(p)), \text{ImCxMul}(R, A, M, \text{fst}(p), \text{snd}(p)) \rangle \rangle \mid \\ p \in (R \times R) \times (R \times R) \} \end{aligned}$$

The definition real numbers embedded in the complex plane.

**definition**

$$\text{ComplexReals}(R, A) \equiv R \times \{\text{TheNeutralElement}(R, A)\}$$

Definition of order relation on the real line.

**definition**

$$\begin{aligned} \text{CplxROrder}(R, A, r) \equiv \\ \text{InducedRelation}(\text{SliceProjection}(\text{ComplexReals}(R, A)), r) \end{aligned}$$

The next locale defines proof context and notation that will be used for complex numbers.

**locale** complex0 =

**fixes** R and A and M and r

**assumes** R\_are\_reals: IsAmodelOfReals(R, A, M, r)

```

fixes complex ( $\mathbb{C}$ )
defines complex_def[simp]:  $\mathbb{C} \equiv \mathbb{R} \times \mathbb{R}$ 

fixes rone ( $1_R$ )
defines rone_def[simp]:  $1_R \equiv \text{TheNeutralElement}(\mathbb{R}, \mathbb{M})$ 

fixes rzero ( $0_R$ )
defines rzero_def[simp]:  $0_R \equiv \text{TheNeutralElement}(\mathbb{R}, \mathbb{A})$ 

fixes one (1)
defines one_def[simp]:  $1 \equiv \langle 1_R, 0_R \rangle$ 

fixes zero (0)
defines zero_def[simp]:  $0 \equiv \langle 0_R, 0_R \rangle$ 

fixes iunit (i)
defines iunit_def[simp]:  $i \equiv \langle 0_R, 1_R \rangle$ 

fixes creal ( $\mathbb{R}$ )
defines creal_def[simp]:  $\mathbb{R} \equiv \{ \langle r, 0_R \rangle . r \in \mathbb{R} \}$ 

fixes rmul (infixl  $\cdot$  71)
defines rmul_def[simp]:  $a \cdot b \equiv M\langle a, b \rangle$ 

fixes radd (infixl  $+$  69)
defines radd_def[simp]:  $a + b \equiv A\langle a, b \rangle$ 

fixes rneg ( $-$  _ 70)
defines rneg_def[simp]:  $- a \equiv \text{GroupInv}(\mathbb{R}, \mathbb{A})(a)$ 

fixes ca (infixl  $+$  69)
defines ca_def[simp]:  $a + b \equiv \text{CplxAdd}(\mathbb{R}, \mathbb{A})\langle a, b \rangle$ 

fixes cm (infixl  $\cdot$  71)
defines cm_def[simp]:  $a \cdot b \equiv \text{CplxMul}(\mathbb{R}, \mathbb{A}, \mathbb{M})\langle a, b \rangle$ 

fixes cdiv (infixl  $/$  70)
defines cdiv_def[simp]:  $a / b \equiv \bigcup \{ x \in \mathbb{C} . b \cdot x = a \}$ 

fixes sub (infixl  $-$  69)
defines sub_def[simp]:  $a - b \equiv \bigcup \{ x \in \mathbb{C} . b + x = a \}$ 

fixes cneg ( $-$  _ 95)
defines cneg_def[simp]:  $- a \equiv 0 - a$ 

fixes lessr (infix  $<_{\mathbb{R}}$  68)
defines lessr_def[simp]:
 $a <_{\mathbb{R}} b \equiv \langle a, b \rangle \in \text{StrictVersion}(\text{CplxROrder}(\mathbb{R}, \mathbb{A}, r))$ 

```

defines six_def[simp]: 6 ≡ 5+1

fixes seven (7)
defines seven_def[simp]: 7 ≡ 6+1

fixes eight (8)
defines eight_def[simp]: 8 ≡ 7+1

fixes nine (9)
defines nine_def[simp]: 9 ≡ 8+1

```

## 50.2 Axioms of complex numbers

In this section we will prove that all Metamath's axioms of complex numbers hold in the `complex0` context.

The next lemma lists some contexts that are valid in the `complex0` context.

```
lemma (in complex0) valid_cntxts: shows
  field1(R,A,M,r)
  field0(R,A,M)
  ring1(R,A,M,r)
  group3(R,A,r)
  ring0(R,A,M)
  M {is commutative on} R
  group0(R,A)
proof -
  from R_are_reals have I: IsAnOrdField(R,A,M,r)
    using IsAmodelOfReals_def by simp
  then show field1(R,A,M,r) using OrdField_ZF_1_L2 by simp
  then show ring1(R,A,M,r) and I: field0(R,A,M)
    using field1.axioms ring1_def field1.OrdField_ZF_1_L1B
    by auto
  then show group3(R,A,r) using ring1.OrdRing_ZF_1_L4
    by simp
  from I have IsAfield(R,A,M) using field0.Field_ZF_1_L1
    by simp
  then have IsARing(R,A,M) and M {is commutative on} R
    using IsAfield_def by auto
  then show ring0(R,A,M) and M {is commutative on} R
    using ring0_def by auto
  then show group0(R,A) using ring0.Ring_ZF_1_L1
    by simp
qed
```

The next lemma shows the definition of real and imaginary part of complex sum and product in a more readable form using notation defined in `complex0` locale.

```
lemma (in complex0) cplx_mul_add_defs: shows
  ReCxAdd(R,A,<a,b>,<c,d>) = a + c
  ImCxAdd(R,A,<a,b>,<c,d>) = b + d
  ImCxMul(R,A,M,<a,b>,<c,d>) = a·d + b·c
  ReCxMul(R,A,M,<a,b>,<c,d>) = a·c + (-b·d)
proof -
  let z1 = <a,b>
  let z2 = <c,d>
  have ReCxAdd(R,A,z1,z2) ≡ A(fst(z1),fst(z2))
    by (rule ReCxAdd_def)
  moreover have ImCxAdd(R,A,z1,z2) ≡ A(snd(z1),snd(z2))
    by (rule ImCxAdd_def)
  moreover have
```

```

    ImCxMul(R,A,M,z1,z2) ≡ A⟨M⟨fst(z1),snd(z2)⟩,M⟨snd(z1),fst(z2)⟩⟩
  by (rule ImCxMul_def)
moreover have
  ReCxMul(R,A,M,z1,z2) ≡
  A⟨M⟨fst(z1),fst(z2)⟩,GroupInv(R,A)(M⟨snd(z1),snd(z2)⟩)⟩
  by (rule ReCxMul_def)
ultimately show
  ReCxAdd(R,A,z1,z2) = a + c
  ImCxAdd(R,A,⟨a,b⟩,⟨c,d⟩) = b + d
  ImCxMul(R,A,M,⟨a,b⟩,⟨c,d⟩) = a·d + b·c
  ReCxMul(R,A,M,⟨a,b⟩,⟨c,d⟩) = a·c + (-b·d)
  by auto

## 51 Topology\_ZF.thy

**theory** Topology\_ZF **imports** ZF1 Finite\_ZF Fol1

**begin**

This theory file provides basic definitions and properties of topology, open and closed sets, closure and boundary.

### 51.1 Basic definitions and properties

A typical textbook defines a topology on a set  $X$  as a collection  $T$  of subsets of  $X$  such that  $X \in T$ ,  $\emptyset \in T$  and  $T$  is closed with respect to arbitrary unions and intersection of two sets. One can notice here that since we always have  $\bigcup T = X$ , the set on which the topology is defined (the "carrier" of the topology) can always be constructed from the topology itself and is superfluous in the definition. Moreover, as Marnix Klooster pointed out to me, the fact that the empty set is open can also be proven from other axioms. Hence, we define a topology as a collection of sets that is closed under arbitrary unions and intersections of two sets, without any mention of the set on which the topology is defined. Recall that  $\text{Pow}(T)$  is the powerset of  $T$ , so that if  $M \in \text{Pow}(T)$  then  $M$  is a subset of  $T$ . The sets that belong to a topology  $T$  will be sometimes called "open in"  $T$  or just "open" if the topology is clear from the context.

Topology is a collection of sets that is closed under arbitrary unions and intersections of two sets.

**definition**

$\text{IsATopology } (\_ \text{ {is a topology} } [90] \ 91) \text{ where}$   
 $T \text{ {is a topology} } \equiv ( \forall M \in \text{Pow}(T). \bigcup M \in T ) \wedge$   
 $( \forall U \in T. \forall V \in T. U \cap V \in T )$

We define interior of a set  $A$  as the union of all open sets contained in  $A$ . We use  $\text{Interior}(A, T)$  to denote the interior of  $A$ .

**definition**

$\text{Interior}(A, T) \equiv \bigcup \{U \in T. U \subseteq A\}$

A set is closed if it is contained in the carrier of topology and its complement is open.

**definition**

$\text{IsClosed } (\text{infixl } \text{ {is closed in} } 90) \text{ where}$   
 $D \text{ {is closed in} } T \equiv (D \subseteq \bigcup T \wedge \bigcup T - D \in T)$

To prove various properties of closure we will often use the collection of closed sets that contain a given set  $A$ . Such collection does not have a separate name in informal math. We will call it  $\text{ClosedCovers}(A, T)$ .

**definition**

$$\text{ClosedCovers}(A, T) \equiv \{D \in \text{Pow}(\bigcup T) . D \text{ \{is closed in\} } T \wedge A \subseteq D\}$$

The closure of a set  $A$  is defined as the intersection of the collection of closed sets that contain  $A$ .

**definition**

$$\text{Closure}(A, T) \equiv \bigcap \text{ClosedCovers}(A, T)$$

We also define boundary of a set as the intersection of its closure with the closure of the complement (with respect to the carrier).

**definition**

$$\text{Boundary}(A, T) \equiv \text{Closure}(A, T) \cap \text{Closure}(\bigcup T - A, T)$$

A set  $K$  is compact if for every collection of open sets that covers  $K$  we can choose a finite one that still covers the set. Recall that  $\text{FinPow}(M)$  is the collection of finite subsets of  $M$  (finite powerset of  $M$ ), defined in IsarMathLib's `Finite_ZF` theory.

**definition**

$$\begin{aligned} &\text{IsCompact (infixl \{is compact in\} 90) where} \\ &K \text{ \{is compact in\} } T \equiv (K \subseteq \bigcup T \wedge \\ &(\forall M \in \text{Pow}(T). K \subseteq \bigcup M \longrightarrow (\exists N \in \text{FinPow}(M). K \subseteq \bigcup N))) \end{aligned}$$

A basic example of a topology: the powerset of any set is a topology.

**lemma** `Pow_is_top`: **shows**  $\text{Pow}(X)$  **\{is a topology\}**

**proof** -

**have**  $\forall A \in \text{Pow}(\text{Pow}(X)). \bigcup A \in \text{Pow}(X)$  **by fast**  
**moreover have**  $\forall U \in \text{Pow}(X). \forall V \in \text{Pow}(X). U \cap V \in \text{Pow}(X)$  **by fast**  
**ultimately show**  $\text{Pow}(X)$  **\{is a topology\}** **using** `IsATopology_def`  
**by auto**

**qed**

Empty set is open.

**lemma** `empty_open`:

**assumes**  $T$  **\{is a topology\}** **shows**  $0 \in T$

**proof** -

**have**  $0 \in \text{Pow}(T)$  **by simp**  
**with assms have**  $\bigcup 0 \in T$  **using** `IsATopology_def` **by blast**  
**thus**  $0 \in T$  **by simp**

**qed**

Union of a collection of open sets is open.

**lemma** `union_open`: **assumes**  $T$  **\{is a topology\}** **and**  $\forall A \in \mathcal{A}. A \in T$

**shows**  $(\bigcup \mathcal{A}) \in T$  **using** `assms IsATopology_def` **by auto**

Union of a indexed family of open sets is open.

**lemma** `union_indexed_open`: **assumes**  $A1$ :  $T$  **\{is a topology\}** **and**  $A2$ :  $\forall i \in I. P(i) \in T$

$P(i) \in T$

shows  $(\bigcup_{i \in I}. P(i)) \in T$  using assms union\_open by simp

The intersection of any nonempty collection of topologies on a set  $X$  is a topology.

```

lemma Inter_tops_is_top:
  assumes A1:  $\mathcal{M} \neq 0$  and A2:  $\forall T \in \mathcal{M}. T \text{ \{is a topology\}}$ 
  shows  $(\bigcap \mathcal{M}) \text{ \{is a topology\}}$ 
proof -
  { fix A assume  $A \in \text{Pow}(\bigcap \mathcal{M})$ 
    with A1 have  $\forall T \in \mathcal{M}. A \in \text{Pow}(T)$  by auto
    with A1 A2 have  $\bigcup A \in \bigcap \mathcal{M}$  using IsATopology_def
    by auto
  } then have  $\forall A. A \in \text{Pow}(\bigcap \mathcal{M}) \longrightarrow \bigcup A \in \bigcap \mathcal{M}$  by simp
  hence  $\forall A \in \text{Pow}(\bigcap \mathcal{M}). \bigcup A \in \bigcap \mathcal{M}$  by auto
  moreover
  { fix U V assume  $U \in \bigcap \mathcal{M}$  and  $V \in \bigcap \mathcal{M}$ 
    then have  $\forall T \in \mathcal{M}. U \in T \wedge V \in T$  by auto
    with A1 A2 have  $\forall T \in \mathcal{M}. U \cup V \in T$  using IsATopology_def
    by simp
  } then have  $\forall U \in \bigcap \mathcal{M}. \forall V \in \bigcap \mathcal{M}. U \cup V \in \bigcap \mathcal{M}$ 
    by auto
  ultimately show  $(\bigcap \mathcal{M}) \text{ \{is a topology\}}$ 
    using IsATopology_def by simp
qed

```

We will now introduce some notation. In Isar, this is done by definining a "locale". Locale is kind of a context that holds some assumptions and notation used in all theorems proven in it. In the locale (context) below called `topology0` we assume that  $T$  is a topology. The interior of the set  $A$  (with respect to the topology in the context) is denoted  $\text{int}(A)$ . The closure of a set  $A \subseteq \bigcup T$  is denoted  $\text{cl}(A)$  and the boundary is  $\partial A$ .

```

locale topology0 =
  fixes T
  assumes topSpaceAssum:  $T \text{ \{is a topology\}}$ 

  fixes int
  defines int_def [simp]:  $\text{int}(A) \equiv \text{Interior}(A, T)$ 

  fixes cl
  defines cl_def [simp]:  $\text{cl}(A) \equiv \text{Closure}(A, T)$ 

  fixes boundary ( $\partial_$  [91] 92)
  defines boundary_def [simp]:  $\partial A \equiv \text{Boundary}(A, T)$ 

```

Intersection of a finite nonempty collection of open sets is open.

```

lemma (in topology0) fin_inter_open_open: assumes  $N \neq 0$   $N \in \text{FinPow}(T)$ 
  shows  $\bigcap N \in T$ 
  using topSpaceAssum assms IsATopology_def inter_two_inter_fin

```

by simp

Having a topology  $T$  and a set  $X$  we can define the induced topology as the one consisting of the intersections of  $X$  with sets from  $T$ . The notion of a collection restricted to a set is defined in ZF1.thy.

```

lemma (in topology0) Top_1_L4:
  shows (T {restricted to} X) {is a topology}
proof -
  let S = T {restricted to} X
  have  $\forall A \in \text{Pow}(S). \bigcup A \in S$ 
  proof
    fix A assume A1:  $A \in \text{Pow}(S)$ 
    have  $\forall V \in A. \bigcup \{U \in T. V = U \cap X\} \in T$ 
    proof -
      { fix V
        let M =  $\{U \in T. V = U \cap X\}$ 
        have  $M \in \text{Pow}(T)$  by auto
        with topSpaceAssum have  $\bigcup M \in T$  using IsATopology_def by simp
        } thus thesis by simp
      qed
      hence  $\bigcup \{U \in T. V = U \cap X\}. V \in A \subseteq T$  by auto
      with topSpaceAssum have  $(\bigcup V \in A. \bigcup \{U \in T. V = U \cap X\}) \in T$ 
        using IsATopology_def by auto
      then have  $(\bigcup V \in A. \bigcup \{U \in T. V = U \cap X\}) \cap X \in S$ 
        using RestrictedTo_def by auto
      moreover
      from A1 have  $\forall V \in A. \exists U \in T. V = U \cap X$ 
        using RestrictedTo_def by auto
      hence  $(\bigcup V \in A. \bigcup \{U \in T. V = U \cap X\}) \cap X = \bigcup A$  by blast
      ultimately show  $\bigcup A \in S$  by simp
    qed
    moreover have  $\forall U \in S. \forall V \in S. U \cap V \in S$ 
    proof -
      { fix U V assume  $U \in S \quad V \in S$ 
        then obtain  $U_1 \ V_1$  where
           $U_1 \in T \wedge U = U_1 \cap X$  and  $V_1 \in T \wedge V = V_1 \cap X$ 
        using RestrictedTo_def by auto

## 52 Topology\_ZF\_1.thy

**theory** Topology\_ZF\_1 **imports** Topology\_ZF

**begin**

In this theory file we study separation axioms and the notion of base and subbase. Using the products of open sets as a subbase we define a natural topology on a product of two topological spaces.

### 52.1 Separation axioms.

Topological spaces can be classified according to certain properties called "separation axioms". In this section we define what it means that a topological space is  $T_0$ ,  $T_1$  or  $T_2$ .

A topology on  $X$  is  $T_0$  if for every pair of distinct points of  $X$  there is an open set that contains only one of them.

**definition**

**isT0** ( $\_ \{is\ T_0\}$  [90] 91) **where**  
 $T \{is\ T_0\} \equiv \forall\ x\ y. ((x \in \bigcup T \wedge y \in \bigcup T \wedge x \neq y) \longrightarrow$   
 $(\exists U \in T. (x \in U \wedge y \notin U) \vee (y \in U \wedge x \notin U)))$

A topology is  $T_1$  if for every such pair there exist an open set that contains the first point but not the second.

**definition**

**isT1** ( $\_ \{is\ T_1\}$  [90] 91) **where**  
 $T \{is\ T_1\} \equiv \forall\ x\ y. ((x \in \bigcup T \wedge y \in \bigcup T \wedge x \neq y) \longrightarrow$   
 $(\exists U \in T. (x \in U \wedge y \notin U)))$

A topology is  $T_2$  (Hausdorff) if for every pair of points there exist a pair of disjoint open sets each containing one of the points. This is an important class of topological spaces. In particular, metric spaces are Hausdorff.

**definition**

**isT2** ( $\_ \{is\ T_2\}$  [90] 91) **where**  
 $T \{is\ T_2\} \equiv \forall\ x\ y. ((x \in \bigcup T \wedge y \in \bigcup T \wedge x \neq y) \longrightarrow$   
 $(\exists U \in T. \exists V \in T. x \in U \wedge y \in V \wedge U \cap V = \emptyset))$

If a topology is  $T_1$  then it is  $T_0$ . We don't really assume here that  $T$  is a topology on  $X$ . Instead, we prove the relation between  $isT_0$  condition and  $isT_1$ .

**lemma** T1\_is\_T0: **assumes** A1:  $T \{is\ T_1\}$  **shows**  $T \{is\ T_0\}$

**proof** -

**from** A1 **have**  $\forall\ x\ y. x \in \bigcup T \wedge y \in \bigcup T \wedge x \neq y \longrightarrow$   
 $(\exists U \in T. x \in U \wedge y \notin U)$   
**using** isT1\_def **by** simp  
**then have**  $\forall\ x\ y. x \in \bigcup T \wedge y \in \bigcup T \wedge x \neq y \longrightarrow$

```

      ( $\exists U \in T. x \in U \wedge y \notin U \vee y \in U \wedge x \notin U$ )
    by auto
  then show  $T \{is\ T_0\}$  using isT0_def by simp
qed

```

If a topology is  $T_2$  then it is  $T_1$ .

```

lemma T2_is_T1: assumes A1:  $T \{is\ T_2\}$  shows  $T \{is\ T_1\}$ 
proof -
  { fix x y assume  $x \in \bigcup T \ y \in \bigcup T \ x \neq y$ 
    with A1 have  $\exists U \in T. \exists V \in T. x \in U \wedge y \in V \wedge U \cap V = \emptyset$ 
      using isT2_def by auto
    then have  $\exists U \in T. x \in U \wedge y \notin U$  by auto
  } then have  $\forall x\ y. x \in \bigcup T \wedge y \in \bigcup T \wedge x \neq y \longrightarrow$ 
    ( $\exists U \in T. x \in U \wedge y \notin U$ ) by simp
  then show  $T \{is\ T_1\}$  using isT1_def by simp
qed

```

In a  $T_0$  space two points that can not be separated by an open set are equal.  
Proof by contradiction.

```

lemma Top_1_1_L1: assumes A1:  $T \{is\ T_0\}$  and A2:  $x \in \bigcup T \ y \in \bigcup T$ 
  and A3:  $\forall U \in T. (x \in U \longleftrightarrow y \in U)$ 
  shows  $x = y$ 
proof -
  { assume  $x \neq y$ 
    with A1 A2 have  $\exists U \in T. x \in U \wedge y \notin U \vee y \in U \wedge x \notin U$ 
      using isT0_def by simp
    with A3 have False by auto
  } then show  $x = y$  by auto
qed

```

## 52.2 Bases and subbases.

Sometimes it is convenient to talk about topologies in terms of their bases and subbases. These are certain collections of open sets that define the whole topology.

A base of topology is a collection of open sets such that every open set is a union of the sets from the base.

### definition

```

IsABaseFor (infixl {is a base for} 65) where
  B {is a base for} T  $\equiv B \subseteq T \wedge T = \{\bigcup A. A \in \text{Pow}(B)\}$ 

```

A subbase is a collection of open sets such that finite intersection of those sets form a base.

### definition

```

IsASubBaseFor (infixl {is a subbase for} 65) where
  B {is a subbase for} T  $\equiv$ 
  B  $\subseteq T \wedge \{\bigcap A. A \in \text{FinPow}(B)\} \{is\ a\ base\ for\} T$ 

```

Below we formulate a condition that we will prove to be necessary and sufficient for a collection  $B$  of open sets to form a base. It says that for any two sets  $U, V$  from the collection  $B$  we can find a point  $x \in U \cap V$  with a neighborhood from  $B$  contained in  $U \cap V$ .

**definition**

```
SatisfiesBaseCondition ( _ {satisfies the base condition} [50] 50)
where
B {satisfies the base condition}  $\equiv$ 
 $\forall U V. ((U \in B \wedge V \in B) \longrightarrow (\forall x \in U \cap V. \exists W \in B. x \in W \wedge W \subseteq U \cap V))$ 
```

A collection that is closed with respect to intersection satisfies the base condition.

```
lemma inter_closed_base: assumes  $\forall U \in B. (\forall V \in B. U \cap V \in B)$ 
shows B {satisfies the base condition}
proof -
  { fix U V x assume  $U \in B$  and  $V \in B$  and  $x \in U \cap V$ 
    with assms have  $\exists W \in B. x \in W \wedge W \subseteq U \cap V$  by blast
  } then show thesis using SatisfiesBaseCondition_def by simp
qed
```

Each open set is a union of some sets from the base.

```
lemma Top_1_2_L1: assumes B {is a base for} T and  $U \in T$ 
shows  $\exists A \in \text{Pow}(B). U = \bigcup A$ 
using assms IsAbaseFor_def by simp
```

Elements of base are open.

```
lemma base_sets_open:
assumes B {is a base for} T and  $U \in B$ 
shows  $U \in T$ 
using assms IsAbaseFor_def by auto
```

A base defines topology uniquely.

```
lemma same_base_same_top:
assumes B {is a base for} T and B {is a base for} S
shows  $T = S$ 
using assms IsAbaseFor_def by simp
```

Every point from an open set has a neighborhood from the base that is contained in the set.

```
lemma point_open_base_neigh:
assumes A1: B {is a base for} T and A2:  $U \in T$  and A3:  $x \in U$ 
shows  $\exists V \in B. V \subseteq U \wedge x \in V$ 
proof -
  from A1 A2 obtain A where  $A \in \text{Pow}(B)$  and  $U = \bigcup A$ 
  using Top_1_2_L1 by blast
  with A3 obtain V where  $V \in A$  and  $x \in V$  by auto
  with 'A  $\in \text{Pow}(B)$ ' 'U =  $\bigcup A$ ' show thesis by auto
```

qed

A criterion for a collection to be a base for a topology that is a slight reformulation of the definition. The only thing different that in the definition is that we assume only that every open set is a union of some sets from the base. The definition requires also the opposite inclusion that every union of the sets from the base is open, but that we can prove if we assume that  $T$  is a topology.

```
lemma is_a_base_criterion: assumes A1: T {is a topology}
  and A2: B  $\subseteq$  T and A3:  $\forall V \in T. \exists A \in \text{Pow}(B). V = \bigcup A$ 
  shows B {is a base for} T
proof -
  from A3 have T  $\subseteq$   $\{\bigcup A. A \in \text{Pow}(B)\}$  by auto
  moreover have  $\{\bigcup A. A \in \text{Pow}(B)\} \subseteq T$ 
  proof
    fix U assume U  $\in$   $\{\bigcup A. A \in \text{Pow}(B)\}$ 
    then obtain A where A  $\in$  Pow(B) and U =  $\bigcup A$ 
    by auto
    with 'B  $\subseteq$  T' have A  $\in$  Pow(T) by auto
    with A1 'U =  $\bigcup A$ ' show U  $\in$  T
    unfolding IsATopology_def by simp
  qed
  ultimately have T =  $\{\bigcup A. A \in \text{Pow}(B)\}$  by auto
  with A2 show B {is a base for} T
  unfolding IsAbaseFor_def by simp
qed
```

A necessary condition for a collection of sets to be a base for some topology : every point in the intersection of two sets in the base has a neighborhood from the base contained in the intersection.

```
lemma Top_1_2_L2:
  assumes A1:  $\exists T. T$  {is a topology}  $\wedge$  B {is a base for} T
  and A2:  $\forall V \in B. \forall W \in B$ 
  shows  $\forall x \in V \cap W. \exists U \in B. x \in U \wedge U \subseteq V \cap W$ 
proof -
  from A1 obtain T where
    D1: T {is a topology} B {is a base for} T
    by auto
  then have B  $\subseteq$  T using IsAbaseFor_def by auto
  with A2 have  $\forall V \in T. \forall W \in T$  using IsAbaseFor_def by auto
  with D1 have  $\exists A \in \text{Pow}(B). V \cap W = \bigcup A$  using IsATopology_def Top_1_2_L1
    by auto
  then obtain A where A  $\subseteq$  B and  $V \cap W = \bigcup A$  by auto

qed
```

We will construct a topology as the collection of unions of (would-be) base. First we prove that if the collection of sets satisfies the condition we want

to show to be sufficient, the the intersection belongs to what we will define as topology (am I clear here?). Having this fact ready simplifies the proof of the next lemma. There is not much topology here, just some set theory.

```

lemma Top_1_2_L3:
  assumes A1:  $\forall x \in V \cap W. \exists U \in B. x \in U \wedge U \subseteq V \cap W$ 
  shows  $V \cap W \in \{\bigcup A. A \in \text{Pow}(B)\}$ 
proof
  let A =  $\bigcup_{x \in V \cap W}. \{U \in B. x \in U \wedge U \subseteq V \cap W\}$ 
  show  $A \in \text{Pow}(B)$  by auto

### 52.3 Product topology

In this section we consider a topology defined on a product of two sets.

Given two topological spaces we can define a topology on the product of the carriers such that the cartesian products of the sets of the topologies are a base for the product topology. Recall that for two collections  $S, T$  of sets the product collection is defined (in `ZF1.thy`) as the collections of cartesian products  $A \times B$ , where  $A \in S, B \in T$ .

**definition**

$\text{ProductTopology}(T, S) \equiv \{\bigcup W. W \in \text{Pow}(\text{ProductCollection}(T, S))\}$

The product collection satisfies the base condition.

**lemma** `Top_1_4_L1`:

assumes  $A1$ :  $T$  {is a topology}     $S$  {is a topology}  
and  $A2$ :  $A \in \text{ProductCollection}(T, S)$      $B \in \text{ProductCollection}(T, S)$   
shows  $\forall x \in (A \cap B). \exists W \in \text{ProductCollection}(T, S). (x \in W \wedge W \subseteq A \cap B)$

**proof**

fix  $x$  assume  $A3$ :  $x \in A \cap B$   
from  $A2$  obtain  $U_1 \ V_1 \ U_2 \ V_2$  where  
 $D1$ :  $U_1 \in T \ V_1 \in S \ A = U_1 \times V_1 \ U_2 \in T \ V_2 \in S \ B = U_2 \times V_2$   
using `ProductCollection_def` by auto  
let  $W = (U_1 \cap U_2) \times (V_1 \cap V_2)$   
from  $A1 \ D1$  have  $U_1 \cap U_2 \in T$  and  $V_1 \cap V_2 \in S$   
using `IsATopology_def` by auto  
then have  $W \in \text{ProductCollection}(T, S)$  using `ProductCollection_def`  
by auto  
moreover from  $A3 \ D1$  have  $x \in W$  and  $W \subseteq A \cap B$  by auto  
ultimately have  $\exists W. (W \in \text{ProductCollection}(T, S) \wedge x \in W \wedge W \subseteq A \cap B)$   
by auto  
thus  $\exists W \in \text{ProductCollection}(T, S). (x \in W \wedge W \subseteq A \cap B)$  by auto

qed

The product topology is indeed a topology on the product.

**theorem** `Top_1_4_T1`: assumes  $A1$ :  $T$  {is a topology}     $S$  {is a topology}  
shows

$\text{ProductTopology}(T, S)$  {is a topology}  
 $\text{ProductCollection}(T, S)$  {is a base for}  $\text{ProductTopology}(T, S)$   
 $\bigcup \text{ProductTopology}(T, S) = \bigcup T \times \bigcup S$

**proof** -

from  $A1$  show  
 $\text{ProductTopology}(T, S)$  {is a topology}  
 $\text{ProductCollection}(T, S)$  {is a base for}  $\text{ProductTopology}(T, S)$   
using `Top_1_4_L1` `ProductCollection_def`  
`SatisfiesBaseCondition_def` `ProductTopology_def` `Top_1_2_T1`  
by auto  
then show  $\bigcup \text{ProductTopology}(T, S) = \bigcup T \times \bigcup S$   
using `Top_1_2_L5` `ZF1_1_L6` by simp

One of the facts demonstrated in every class on General Topology is that in a  $T_2$  (Hausdorff) topological space compact sets are closed. Formalizing the proof of this fact gave me an interesting insight into the role of the Axiom of Choice (AC) in many informal proofs.

A typical informal proof of this fact goes like this: we want to show that the complement of  $K$  is open. To do this, choose an arbitrary point  $y \in K^c$ . Since  $X$  is  $T_2$ , for every point  $x \in K$  we can find an open set  $U_x$  such that  $y \notin \overline{U_x}$ . Obviously  $\{U_x\}_{x \in K}$  covers  $K$ , so select a finite subcollection that covers  $K$ , and so on. I had never realized that such reasoning requires the Axiom of Choice. Namely, suppose we have a lemma that states "In  $T_2$  spaces, if  $x \neq y$ , then there is an open set  $U$  such that  $x \in U$  and  $y \notin \overline{U}$ " (like our lemma `T2_cl_open_sep` below). This only states that the set of such open sets  $U$  is not empty. To get the collection  $\{U_x\}_{x \in K}$  in this proof we have to select one such set among many for every  $x \in K$  and this is where we use the Axiom of Choice. Probably in 99/100 cases when an informal calculus proof states something like  $\forall \varepsilon \exists \delta_\varepsilon \dots$  the proof uses AC. Most of the time the use of AC in such proofs can be avoided. This is also the case for the fact that in a  $T_2$  space compact sets are closed.

### 53.1 Compact sets are closed - no need for AC

In this section we show that in a  $T_2$  topological space compact sets are closed.

First we prove a lemma that in a  $T_2$  space two points can be separated by the closure of an open set.

```
lemma (in topology0) T2_cl_open_sep:
  assumes T {is T2} and x ∈ ⋃ T y ∈ ⋃ T x ≠ y
  shows ∃ U ∈ T. (x ∈ U ∧ y ∉ cl(U))
proof -
  from assms have ∃ U ∈ T. ∃ V ∈ T. x ∈ U ∧ y ∈ V ∧ U ∩ V = 0
  using isT2_def by simp
  then obtain U V where U ∈ T V ∈ T x ∈ U y ∈ V U ∩ V = 0
  by auto
  then have U ∈ T ∧ x ∈ U ∧ y ∈ V ∧ cl(U) ∩ V = 0
  using disj_open_cl_disj by auto
  thus ∃ U ∈ T. (x ∈ U ∧ y ∉ cl(U)) by auto
qed
```

AC-free proof that in a Hausdorff space compact sets are closed. To understand the notation recall that in Isabelle/ZF `Pow(A)` is the powerset (the

set of subsets) of  $A$  and  $\text{FinPow}(A)$  denotes the set of finite subsets of  $A$  in IsarMathLib.

```

## 54 Topology\_ZF\_2.thy

```
theory Topology_ZF_2 imports Topology_ZF_1 func1 Fol1
```

```
begin
```

This theory continues the series on general topology and covers the definition and basic properties of continuous functions. We also introduce the notion of homeomorphism and prove the pasting lemma.

### 54.1 Continuous functions.

In this section we define continuous functions and prove that certain conditions are equivalent to a function being continuous.

In standard math we say that a function is continuous with respect to two topologies  $\tau_1, \tau_2$  if the inverse image of sets from topology  $\tau_2$  are in  $\tau_1$ . Here we define a predicate that is supposed to reflect that definition, with a difference that we don't require in the definition that  $\tau_1, \tau_2$  are topologies. This means for example that when we define measurable functions, the definition will be the same.

The notation  $f^{-1}(A)$  means the inverse image of (a set)  $A$  with respect to (a function)  $f$ .

**definition**

```
IsContinuous( $\tau_1, \tau_2, f$ )  $\equiv (\forall U \in \tau_2. f^{-1}(U) \in \tau_1)$ 
```

A trivial example of a continuous function - identity is continuous.

```
lemma id_cont: shows IsContinuous( $\tau, \tau, \text{id}(\bigcup \tau)$ )
```

```
proof -
```

```
  { fix U assume U  $\in \tau$ 
    then have  $\text{id}(\bigcup \tau)^{-1}(U) = U$  using vimage_id_same by auto
    with 'U  $\in \tau$ ' have  $\text{id}(\bigcup \tau)^{-1}(U) \in \tau$  by simp
  } then show IsContinuous( $\tau, \tau, \text{id}(\bigcup \tau)$ ) using IsContinuous_def
    by simp
```

```
qed
```

We will work with a pair of topological spaces. The following locale sets up our context that consists of two topologies  $\tau_1, \tau_2$  and a continuous function  $f : X_1 \rightarrow X_2$ , where  $X_i$  is defined as  $\bigcup \tau_i$  for  $i = 1, 2$ . We also define notation  $\text{cl}_1(A)$  and  $\text{cl}_2(A)$  for closure of a set  $A$  in topologies  $\tau_1$  and  $\tau_2$ , respectively.

```
locale two_top_spaces0 =
```

```
  fixes  $\tau_1$ 
  assumes tau1_is_top:  $\tau_1$  {is a topology}
```

```

fixes  $\tau_2$ 
assumes tau2_is_top:  $\tau_2$  {is a topology}

fixes  $X_1$ 
defines X1_def [simp]:  $X_1 \equiv \bigcup \tau_1$ 

fixes  $X_2$ 
defines X2_def [simp]:  $X_2 \equiv \bigcup \tau_2$ 

fixes  $f$ 
assumes fmapAssum:  $f: X_1 \rightarrow X_2$ 

fixes isContinuous ( $\_$  {is continuous} [50] 50)
defines isContinuous_def [simp]:  $g$  {is continuous}  $\equiv$  IsContinuous( $\tau_1, \tau_2, g$ )

fixes  $cl_1$ 
defines cl1_def [simp]:  $cl_1(A) \equiv \text{Closure}(A, \tau_1)$ 

fixes  $cl_2$ 
defines cl2_def [simp]:  $cl_2(A) \equiv \text{Closure}(A, \tau_2)$ 

```

First we show that theorems proven in locale topology0 are valid when applied to topologies  $\tau_1$  and  $\tau_2$ .

```

lemma (in two_top_spaces0) topol_cntxs_valid:
  shows topology0( $\tau_1$ ) and topology0( $\tau_2$ )

### 54.3 Topologies induced by mappings

In this section we consider various ways a topology may be defined on a set that is the range (or the domain) of a function whose domain (or range) is a topological space.

A bijection from a topological space induces a topology on the range.

**theorem** `bij_induced_top`: **assumes** `A1: T {is a topology}` **and** `A2:  $f \in \text{bij}(\bigcup T, Y)$`   
**shows**  
`{ $f(U). U \in T$ } {is a topology}` **and**  
`{ $\{f(x). x \in U\}. U \in T$ } {is a topology}` **and**  
 `$(\bigcup \{f(U). U \in T\}) = Y$  and  
IsAhomeomorphism( $T, \{f(U). U \in T\}, f$ )`

**proof** -

```

    from A2 have  $f \in \text{inj}(\bigcup T, Y)$  using bij_def by simp
    then have  $f: \bigcup T \rightarrow Y$  using inj_def by simp
    let  $S = \{f(U). U \in T\}$ 
    { fix M assume  $M \in \text{Pow}(S)$ 
      let  $M_T = \{f^{-1}(V). V \in M\}$ 
      have  $M_T \subseteq T$ 
      proof
        fix W assume  $W \in M_T$ 
        then obtain V where  $V \in M$  and  $I: W = f^{-1}(V)$  by auto
        with 'M ∈ Pow(S)' have  $V \in S$  by auto
        then obtain U where  $U \in T$  and  $V = f(U)$  by auto
        with I have  $W = f^{-1}(f(U))$  by simp
        with ' $f \in \text{inj}(\bigcup T, Y)$ ' ' $U \in T$ ' have  $W = U$  using inj_vimage_image

#### 54.4 Partial functions and continuity

Suppose we have two topologies  $\tau_1, \tau_2$  on sets  $X_i = \bigcup \tau_i, i = 1, 2$ . Consider some function  $f : A \rightarrow X_2$ , where  $A \subseteq X_1$  (we will call such function "partial"). In such situation we have two natural possibilities for the pairs of topologies with respect to which this function may be continuous. One is obviously the original  $\tau_1, \tau_2$  and in the second one the first element of the pair is the topology relative to the domain of the function:  $\{A \cap U | U \in \tau_1\}$ . These two possibilities are not exactly the same and the goal of this section is to explore the differences.

If a function is continuous, then its restriction is continuous in relative topology.

```

lemma (in two_top_spaces0) restr_cont:
  assumes A1:  $A \subseteq X_1$  and A2: f {is continuous}
  shows IsContinuous( $\tau_1$  {restricted to} A,  $\tau_2$ , restrict(f,A))

## 54.5 Product topology and continuity

We start with three topological spaces  $(\tau_1, X_1)$ ,  $(\tau_2, X_2)$  and  $(\tau_3, X_3)$  and a function  $f : X_1 \times X_2 \rightarrow X_3$ . We will study the properties of  $f$  with respect to the product topology  $\tau_1 \times \tau_2$  and  $\tau_3$ . This situation is similar as in locale `two_top_spaces0` but the first topological space is assumed to be a product of two topological spaces.

First we define a locale with three topological spaces.

```
locale prod_top_spaces0 =

  fixes  $\tau_1$ 
  assumes tau1_is_top:  $\tau_1$  {is a topology}

  fixes  $\tau_2$ 
  assumes tau2_is_top:  $\tau_2$  {is a topology}

  fixes  $\tau_3$ 
  assumes tau3_is_top:  $\tau_3$  {is a topology}

  fixes  $X_1$ 
  defines X1_def [simp]:  $X_1 \equiv \bigcup_{\tau_1}$ 

  fixes  $X_2$ 
  defines X2_def [simp]:  $X_2 \equiv \bigcup_{\tau_2}$ 

  fixes  $X_3$ 
  defines X3_def [simp]:  $X_3 \equiv \bigcup_{\tau_3}$ 

  fixes  $\eta$

## 54.6 Pasting lemma

The classical pasting lemma states that if  $U_1, U_2$  are both open (or closed) and a function is continuous when restricted to both  $U_1$  and  $U_2$  then it is continuous when restricted to  $U_1 \cup U_2$ . In this section we prove a generalization statement stating that the set  $\{U \in \tau_1 \mid f|_U \text{ is continuous}\}$  is a topology.

A typical statement of the pasting lemma uses the notion of a function restricted to a set being continuous without specifying the topologies with respect to which this continuity holds. In `two_top_spaces0` context the notation `g {is continuous}` means continuity with respect to topologies  $\tau_1, \tau_2$ . The next lemma is a special case of `partial_fun_cont` and states that if for some set  $A \subseteq X_1 = \bigcup \tau_1$  the function  $f|_A$  is continuous (with respect to  $(\tau_1, \tau_2)$ ), then  $A$  has to be open. This clears up terminology and indicates why we need to pay attention to the issue of which topologies we talk about when we say that the restricted (to some closed set for example) function is continuous.

```

## 55 Topology\_ZF\_3.thy

**theory** Topology\_ZF\_3 **imports** Topology\_ZF\_2 FiniteSeq\_ZF

**begin**

Topology\_ZF\_1 theory describes how we can define a topology on a product of two topological spaces. One way to generalize that is to construct topology for a cartesian product of  $n$  topological spaces. The cartesian product approach is somewhat inconvenient though. Another way to approach product topology on  $X^n$  is to model cartesian product as sets of sequences (of length  $n$ ) of elements of  $X$ . This means that having a topology on  $X$  we want to define a topology on the space  $n \rightarrow X$ , where  $n$  is a natural number (recall that  $n = \{0, 1, \dots, n-1\}$  in ZF). However, this in turn can be done more generally by defining a topology on any function space  $I \rightarrow X$ , where  $I$  is any set of indices. This is what we do in this theory.

### 55.1 The base of the product topology

In this section we define the base of the product topology.

Suppose  $\mathcal{X} = I \rightarrow \bigcup T$  is a space of functions from some index set  $I$  to the carrier of a topology  $T$ . Then take a finite collection of open sets  $W : N \rightarrow T$  indexed by  $N \subseteq I$ . We can define a subset of  $\mathcal{X}$  that models the cartesian product of  $W$ .

**definition**

$$\text{FinProd}(\mathcal{X}, W) \equiv \{x \in \mathcal{X}. \forall i \in \text{domain}(W). x(i) \in W(i)\}$$

Now we define the base of the product topology as the collection of all finite products (in the sense defined above) of open sets.

**definition**

$$\text{ProductTopBase}(I, T) \equiv \bigcup_{N \in \text{FinPow}(I)} \{\text{FinProd}(I \rightarrow \bigcup T, W). W \in N \rightarrow T\}$$

Finally, we define the product topology on sequences. We use the "Seq" prefix although the definition is good for any index sets, not only natural numbers.

**definition**

$$\text{SeqProductTopology}(I, T) \equiv \{\bigcup B. B \in \text{Pow}(\text{ProductTopBase}(I, T))\}$$

Product topology base is closed with respect to intersections.

**lemma** prod\_top\_base\_inter:

**assumes** A1:  $T$  {is a topology} **and**  
A2:  $U \in \text{ProductTopBase}(I, T) \quad V \in \text{ProductTopBase}(I, T)$   
**shows**  $U \cap V \in \text{ProductTopBase}(I, T)$

**proof** -

**let**  $\mathcal{X} = I \rightarrow \bigcup T$

```

## 55.2 Finite product of topologies

As a special case of the space of functions  $I \rightarrow X$  we can consider space of lists of elements of  $X$ , i.e. space  $n \rightarrow X$ , where  $n$  is a natural number (recall that in ZF set theory  $n = \{0, 1, \dots, n-1\}$ ). Such spaces model finite cartesian products  $X^n$  but are easier to deal with in formalized way (than the said products). This section discusses natural topology defined on  $n \rightarrow X$  where  $X$  is a topological space.

When the index set is finite, the definition of `ProductTopBase(I,T)` can be simplified.

```

Intuitively, the topological space of singleton lists valued in  $X$  is the same as  $X$ . However, each element of this space is a list of length one, i.e a set consisting of a pair  $\langle 0, x \rangle$  where  $x$  is an element of  $X$ . The next lemma provides a formula for the product topology in the corner case when we have only one factor and shows that the product topology of one space is essentially the same as the space.

```

In the `Topology_ZF_2` theory we define product topology of two topological spaces. The next lemma explains in what sense the topology on finite lists of length  $n$  of elements of topological space  $X$  can be thought as a model of the product topology on the cartesian product of  $n$  copies of that space. Namely, we show that the space of lists of length  $n + 1$  of elements of  $X$  is homeomorphic to the product topology (as defined in `Topology_ZF_2`) of two spaces: the space of lists of length  $n$  and  $X$ . Recall that if  $\mathcal{B}$  is a base (i.e. satisfies the base condition), then the collection  $\{\bigcup B \mid B \in \text{Pow}(\mathcal{B})\}$  is a topology (generated by  $\mathcal{B}$ ).

**theorem finite\_top\_prod\_homeo:** assumes A1:  $\tau$  {is a topology} and A2:  $n \in \text{nat}$  and

A3:  $f = \{ \langle x, \langle \text{Init}(x), x(n) \rangle \rangle. x \in \text{succ}(n) \rightarrow \bigcup \tau \}$  and

```

This theory deals with convergence in topological spaces. Contributed by Daniel de la Concepcion.

### 56.1 Nets

Nets are a generalization of sequences. It is known that sequences do not determine the behavior of the topological spaces that are not first countable; i.e., have a countable neighborhood base for each point. To solve this problem, nets were defined so that the behavior of any topological space can be thought in terms of convergence of nets.

First we need to define what a directed set is:

**definition**

```
  IsDirectedSet (_ directs _ 90)
  where r directs D  $\equiv$  refl(D,r)  $\wedge$  trans(r)  $\wedge$  ( $\forall x \in D. \forall y \in D. \exists z \in D. \langle x, z \rangle \in r$ 
 $\wedge \langle y, z \rangle \in r$ )
```

Any linear order is a directed set; in particular  $(\mathbb{N}, \leq)$ .

**lemma** linorder\_imp\_directed:

```
  assumes IsLinOrder(X,r)
  shows r directs X
```

**proof-**

```
  from assms have trans(r) using IsLinOrder_def by auto
  moreover
  from assms have r:refl(X,r) using IsLinOrder_def total_is_refl by auto
  moreover
  {
    fix x y
    assume R: x  $\in$  X y  $\in$  X
    with assms have  $\langle x, y \rangle \in r \vee \langle y, x \rangle \in r$  using IsLinOrder_def IsTotal_def
  by auto
    with r have  $(\langle x, y \rangle \in r \wedge \langle y, y \rangle \in r) \vee (\langle y, x \rangle \in r \wedge \langle x, x \rangle \in r)$  using R refl_def
  by auto
    then have  $\exists z \in X. \langle x, z \rangle \in r \wedge \langle y, z \rangle \in r$  using R by auto
  }
  ultimately show thesis using IsDirectedSet_def function_def by auto
qed
```

**corollary** Le\_directs\_nat:

```
  shows IsLinOrder(nat,Le) Le directs nat
```

**proof-**

```
  have antisym(Le) unfolding antisym_def Le_def using le_anti_sym by
auto moreover
```

```

have trans(Le) unfolding trans_def Le_def using le_trans by auto more-
over
{
  fix n m assume n∈nat m∈nat
  then have Ord(n) Ord(m) using nat_into_Ord by auto
  then have n≤m ∨ m≤n using Ord_linear_le[where thesis=n≤m ∨ m≤n]
by auto
}
then have Le{is total on}nat unfolding IsTotal_def Le_def by auto
ultimately show IsLinOrder(nat,Le) unfolding IsLinOrder_def by auto
then show Le directs nat using linorder_imp_directed by auto
qed

```

We are able to define the concept of net, now that we now what a directed set is.

**definition**

```

IsNet (_ {is a net on} _ 90)
  where N {is a net on} X ≡ fst(N):domain(fst(N))→X ∧ (snd(N) directs
domain(fst(N))) ∧ domain(fst(N))≠0

```

Provided a topology and a net directed on its underlying set, we can talk about convergence of the net in the topology.

**definition** (in topology0)

```

NetConverges (_ →N _ 90)
  where N {is a net on} ⋃T ⇒ N →N x ≡
(x∈⋃T) ∧ (∀U∈Pow(⋃T). (x∈int(U) ⇒ (∃t∈domain(fst(N)). ∀m∈domain(fst(N)).
  (⟨t,m⟩∈snd(N) ⇒ fst(N)m∈U))))

```

One of the most important directed sets, is the neighborhoods of a point.

**theorem** (in topology0) directedset\_neighborhoods:

```

assumes x∈⋃T

## 56.2 Filters

Nets are a generalization of sequences that can make us see that not all topological spaces can be described by sequences. Nevertheless, nets are not always the tool used to deal with convergence. The reason is that they make use of directed sets which are completely unrelated with the topology.

The topological tools to deal with convergence are what is called filters.

**definition**

```

IsFilter (_ {is a filter on} _ 90)
where  $\mathcal{F}$  {is a filter on} X  $\equiv (0 \notin \mathcal{F}) \wedge (X \in \mathcal{F}) \wedge (\mathcal{F} \subseteq \text{Pow}(X)) \wedge$ 
 $(\forall A \in \mathcal{F}. \forall B \in \mathcal{F}. A \cap B \in \mathcal{F}) \wedge (\forall B \in \mathcal{F}. \forall C \in \text{Pow}(X). B \subseteq C \longrightarrow C \in \mathcal{F})$ 

```

Not all the sets of a filter are needed to be consider at all times; as it happens with a topology we can consider bases.

**definition**

```

IsBaseFilter (_ {is a base filter} _ 90)
where C {is a base filter}  $\mathcal{F} \equiv C \subseteq \mathcal{F} \wedge \mathcal{F} = \{A \in \text{Pow}(\bigcup \mathcal{F}). (\exists D \in C. D \subseteq A)\}$ 

```

Not every set is a base for a filter, as it happens with topologies, there is a condition to be satisfied.

**definition**

```

SatisfiesFilterBase (_ {satisfies the filter base condition} 90)
where C {satisfies the filter base condition}  $\equiv (\forall A \in C. \forall B \in C. \exists D \in C. D \subseteq A \cap B) \wedge C \neq \emptyset \wedge \emptyset \notin C$ 

```

Every set of a filter contains a set from the filter's base.

```

lemma basic_element_filter:
  assumes A ∈  $\mathcal{F}$  and C {is a base filter}  $\mathcal{F}$ 
  shows  $\exists D \in C. D \subseteq A$ 
proof-
  from assms(2) have t:  $\mathcal{F} = \{A \in \text{Pow}(\bigcup \mathcal{F}). (\exists D \in C. D \subseteq A)\}$  using IsBaseFilter_def
by auto
  with assms(1) have A ∈  $\{A \in \text{Pow}(\bigcup \mathcal{F}). (\exists D \in C. D \subseteq A)\}$  by auto
  then have A ∈  $\text{Pow}(\bigcup \mathcal{F}) \ \exists D \in C. D \subseteq A$  by auto
  then show thesis by auto
qed

```

The following two results state that the filter base condition is necessary and sufficient for the filter generated by a base, to be an actual filter. The third result, rewrites the previous two.

```

theorem basic_filter_1:
  assumes C {is a base filter}  $\mathcal{F}$  and C {satisfies the filter base condition}
  shows  $\mathcal{F}$  {is a filter on}  $\bigcup \mathcal{F}$ 
proof-
  {
    fix A B
    assume AF: A ∈  $\mathcal{F}$  and BF: B ∈  $\mathcal{F}$ 
    with assms(1) have  $\exists D_A \in C. D_A \subseteq A$  using basic_element_filter by simp
    then obtain DA where perA:  $D_A \in C$  and subA:  $D_A \subseteq A$  by auto

The convergence for filters is much easier concept to write. Given a topology and a filter on the same underlying set, we can define convergence as containing all the neighborhoods of the point.

**definition** (in topology0)  
 FilterConverges ( $\_ \rightarrow_F \_ 50$ ) **where**  
 $\mathfrak{F}\{\text{is a filter on}\}\bigcup T \implies \mathfrak{F} \rightarrow_F x \equiv$   
 $x \in \bigcup T \wedge (\{U \in \text{Pow}(\bigcup T). x \in \text{int}(U)\} \subseteq \mathfrak{F})$

The neighborhoods of a point form a filter that converges to that point.

**lemma** (in topology0) neigh\_filter:  
 assumes  $x \in \bigcup T$   
 defines  $\text{Neigh} \equiv \{U \in \text{Pow}(\bigcup T). x \in \text{int}(U)\}$   
 shows  $\text{Neigh} \{\text{is a filter on}\}\bigcup T$  and  $\text{Neigh} \rightarrow_F x$   
**proof-**  
 {  
   fix A B  
   assume  $p: A \in \text{Neigh} \ B \in \text{Neigh}$   
   have  $A \cap B \in \text{Neigh}$   
   **proof-**  
     from p have  $A \cap B \in \text{Pow}(\bigcup T)$  using Neigh\_def by auto  
     **moreover**  
     {from p have  $x \in \text{int}(A) \ x \in \text{int}(B)$  using Neigh\_def by auto  
       then have  $x \in \text{int}(A) \cap \text{int}(B)$  by auto  
       **moreover**  
       { have  $\text{int}(A) \cap \text{int}(B) \subseteq A \cap B$  using Top\_2\_L1 by auto  
         **moreover** have  $\text{int}(A) \cap \text{int}(B) \in T$   
           using Top\_2\_L2 topSpaceAssum IsATopology\_def by blast  
           ultimately have  $\text{int}(A) \cap \text{int}(B) \subseteq \text{int}(A \cap B)$  using Top\_2\_L5 by auto  
           ultimately have  $x \in \text{int}(A \cap B)$  by auto  
       }

by auto
qed

```

Note that with the net we built in a previous result, it wasn't clear that we could construct an actual net that converged to the given point without the axiom of choice. With filters, there is no problem.

Another positive point of filters is due to the existence of filter basis. If we have a basis for a filter, then the filter converges to a point iff every neighborhood of that point contains a basic filter element.

```

theorem (in topology0) convergence_filter_base1:

### 56.3 Relation between nets and filters

In this section we show that filters do not generalize nets, but still nets and filter are in w way equivalent as far as convergence is considered.

Let's build now a net from a filter, such that both converge to the same points.

**definition**

```

NetOfFilter (Net(_) 40) where
 $\mathcal{F}$  {is a filter on}  $\bigcup \mathcal{F} \implies \text{Net}(\mathcal{F}) \equiv$ 
 $\{\langle A, \text{fst}(A) \rangle. A \in \{\langle x, F \rangle \in (\bigcup \mathcal{F}) \times \mathcal{F}. x \in F\}, \langle A, B \rangle \in \{\langle x, F \rangle \in (\bigcup \mathcal{F}) \times \mathcal{F}. x \in F\} \times \{\langle x, F \rangle \in (\bigcup \mathcal{F}) \times \mathcal{F}. x \in F\}. \text{snd}(B) \subseteq \text{snd}(A)\}\}$ 

```

Net of a filter is indeed a net.

**theorem net\_of\_filter\_is\_net:**

```

  assumes  $\mathcal{F}$  {is a filter on}  $X$ 
  shows  $(\text{Net}(\mathcal{F}))$  {is a net on}  $X$ 

```

**proof-**

```

  from assms have  $X \in \mathcal{F}$   $\mathcal{F} \subseteq \text{Pow}(X)$  using IsFilter_def by auto
  then have uu:  $\bigcup \mathcal{F} = X$  by blast
  let f =  $\{\langle A, \text{fst}(A) \rangle. A \in \{\langle x, F \rangle \in (\bigcup \mathcal{F}) \times \mathcal{F}. x \in F\}\}$ 
  let r =  $\{\langle A, B \rangle \in \{\langle x, F \rangle \in (\bigcup \mathcal{F}) \times \mathcal{F}. x \in F\} \times \{\langle x, F \rangle \in (\bigcup \mathcal{F}) \times \mathcal{F}. x \in F\}. \text{snd}(B) \subseteq \text{snd}(A)\}\}$ 
  have function(f) using function_def by auto
  moreover have relation(f) using relation_def by auto

The previous result states that, when considering convergence, the filters do not generalize nets. When considering a filter, there is always a net that converges to the same points of the original filter.

Now we see that with nets, results come naturally applying the axiom of choice; but with filters, the results come, may be less natural, but with no choice. The reason is that  $\text{Net}(\mathcal{F})$  is a net that doesn't come into our attention as a first choice; maybe because we restrict ourselves to the anti-symmetry property of orders without realizing that a directed set is not an order.

The following results will state that filters are not just a subclass of nets, but that nets and filters are equivalent on convergence: for every filter there is a net converging to the same points, and also, for every net there is a filter converging to the same points.

We know now that filters and nets are the same thing, when working convergence of topological spaces. Sometimes, the nature of filters makes it easier to generalize them as follows.

Instead of considering all subsets of some set  $X$ , we can consider only open sets (we get an open filter) or closed sets (we get a closed filter). There are many more useful examples that characterize topological properties.

This type of generalization cannot be done with nets.

Also a filter can give us a topology in the following way:

```

theorem top_of_filter:
  assumes  $\mathcal{F}$  {is a filter on}  $\bigcup \mathcal{F}$ 
  shows  $(\mathcal{F} \cup \{0\})$  {is a topology}

```

```

This theory deals with some concrete examples of topologies.

### 57.1 CoCardinal Topology of a set $X$

#### 57.1.1 CoCardinal topology is a topology.

The collection of subsets of a set whose complement is strictly bounded by a cardinal is a topology given some assumptions on the cardinal.

**definition** Cocardinal (CoCardinal  $\_ \_ 50$ ) **where**  
CoCardinal  $X \ T \equiv \{F \in \text{Pow}(X). X - F \prec T\} \cup \{0\}$

For any set and any infinite cardinal; we prove that CoCardinal  $X \ Q$  forms a topology. The proof is done with an infinite cardinal, but it is obvious that the set  $Q$  can be any set equipollent with an infinite cardinal. It is a topology also if the set where the topology is defined is too small or the cardinal too large; in this case, as it is later proved the topology is a discrete topology. And the last case corresponds with  $Q = 1$  which translates in the indiscrete topology.

```
lemma CoCar_is_topology:
  assumes InfCard (Q)
  shows (CoCardinal X Q) {is a topology}

qed

```

```

theorem topology0_CoCardinal:
  assumes InfCard(T)
  shows topology0(CoCardinal X T)
  using topology0_def CoCar_is_topology assms by auto

```

It can also be proven that, if  $\text{CoCardinal } X \text{ } T$  is a topology,  $X \neq 0$ ,  $\text{Card}(T)$  and  $T \neq 0$ ; then  $T$  is an infinite cardinal,  $X < T$  or  $T=1$ . It follows from the fact that the union of two closed sets is closed.

Choosing the appropriate cardinals, the cofinite and the cocountable topologies are obtained.

The cofinite topology is a very special topology because is extremely related to the separation axiom  $T_1$ . It also appears naturally in algebraic geometry.

### 57.1.2 Total set, Closed sets, Interior, Closure and Boundary

There are several assertions that can be done to the  $\text{CoCardinal } X \text{ } T$  topology. In each case, we will not assume sufficient conditions for  $\text{CoCardinal } X \text{ } T$  to be a topology, but they will be enough to do the calculations in every possible case.

The topology is defined in the set  $X$

```
lemma union_cocardinal:
  assumes  $T \neq 0$ 
  shows  $\bigcup (\text{CoCardinal } X \text{ } T) = X$ 
proof-
  have  $X - X = 0$  by auto
  have  $0 \lesssim 0$  by auto
  with assms have  $0 <_{11} \lesssim T$  using not_0_is_lepoll_1 lepoll_imp_lesspoll_succ
  by auto
  then have  $0 < T$  using lesspoll_trans2 by auto
  with X have  $(X - X) < T$  by auto
  then have  $X \in (\text{CoCardinal } X \text{ } T)$  using Cocardinal_def by auto
  hence  $X \subseteq \bigcup (\text{CoCardinal } X \text{ } T)$  by blast
  then show  $\bigcup (\text{CoCardinal } X \text{ } T) = X$  using Cocardinal_def by auto
qed
```

The closed sets are the small subsets of  $X$  and  $X$  itself.

```
lemma closed_sets_cocardinal:
  assumes  $T \neq 0$ 
  shows  $D \{\text{is closed in}\} (\text{CoCardinal } X \text{ } T) \longleftrightarrow (D \in \text{Pow}(X) \ \& \ D < T) \vee D = X$ 
proof-
  {
    assume  $A: D \subseteq X \text{ } X - D \in (\text{CoCardinal } X \text{ } T) \ D \neq X$ 
    from A(1,3) have  $X - (X - D) = D \ X - D \neq 0$  by (safe,blast+)
    with A(2) have  $D < T$  using Cocardinal_def by simp
  }
  with assms have  $D \{\text{is closed in}\} (\text{CoCardinal } X \text{ } T) \longrightarrow (D \in \text{Pow}(X) \ \& \ D < T) \vee D = X$ 
  using IsClosed_def
  union_cocardinal by auto
  moreover
  {
    assume  $A: D < T \ D \subseteq X$ 
    from A(2) have  $X - (X - D) = D$  by blast
    with A(1) have  $X - (X - D) < T$  by auto
    then have  $X - D \in (\text{CoCardinal } X \text{ } T)$  using Cocardinal_def by auto
  }
  with assms have  $(D \in \text{Pow}(X) \ \& \ D < T) \longrightarrow D \{\text{is closed in}\} (\text{CoCardinal } X \text{ } T)$ 
  using union_cocardinal
  IsClosed_def by auto
  moreover
  have  $X - X = 0$  by auto
  then have  $X - X \in (\text{CoCardinal } X \text{ } T)$  using Cocardinal_def by auto

### 57.3 Included Set Topology

In this section we consider the subsets of a set which contain a fixed set.

The family defined in this section and the one in the previous section are dual; meaning that the closed set of one are the open sets of the other.

#### 57.3.1 Included set topology is a topology.

**definition**

IncludedSet (IncludedSet \_ \_ 50) where  
IncludedSet X U  $\equiv \{F \in \text{Pow}(X). U \subseteq F\} \cup \{0\}$

For any set; we prove that IncludedSet X Q forms a topology.

**theorem** includedset\_is\_topology:

shows (IncludedSet X Q) {is a topology}

**proof-**

```
{
  fix M
  assume M ∈ Pow(IncludedSet X Q)
  then have A: M ⊆ {F ∈ Pow(X). Q ⊆ F} ∪ {0} using IncludedSet_def by auto
  then have ⋃ M ∈ Pow(X) by auto
  moreover
  have Q ⊆ ⋃ M ∨ ⋃ M = 0 using A by blast
  ultimately have ⋃ M ∈ (IncludedSet X Q) using IncludedSet_def by auto
}
moreover
{
  fix U V
  assume U ∈ (IncludedSet X Q) V ∈ (IncludedSet X Q)
  then have U ∈ Pow(X) V ∈ Pow(X) U = 0 ∨ Q ⊆ U ∨ Q ⊆ V using IncludedSet_def
by auto
  then have U ∈ Pow(X) V ∈ Pow(X) (U ∩ V) = 0 ∨ Q ⊆ (U ∩ V) by auto
  then have (U ∩ V) ∈ (IncludedSet X Q) using IncludedSet_def by auto
}
ultimately show thesis using IsATopology_def by auto
qed
```

**theorem** topology0\_includedset:

shows topology0(IncludedSet X T)  
using topology0\_def includedset\_is\_topology by auto

Choosing a singleton set, it is considered a point excluded topology. In the following lemmas and theorems, when necessary it will be considered that  $T \neq 0$  and  $T \subseteq X$ . These cases will appear in the special cases section.

**definition**

IncludedPoint (IncludedPoint \_ \_ 90) where  
IncludedPoint X p  $\equiv$  IncludedSet X {p}

### 57.3.2 Total set, Closed sets, Interior, Closure and Boundary

The topology is defined in the set  $X$ .

```

### 57.3.3 Special cases and subspaces

The topology is discrete if  $T = 0$

```
lemma smaller_includedset:
  shows (IncludedSet X 0)=Pow(X)
  using IncludedSet_def by (simp,blast)
```

If the set which is included is not a subset of  $X$ , then the topology is trivial.

```
lemma empty_includedset:
  assumes  $\sim(T \subseteq X)$ 
  shows (IncludedSet X T)={0}
  using assms IncludedSet_def by (simp,blast)
```

The topological subspaces of the  $\text{IncludedSet } X \ T$  topology are also  $\text{IncludedSet}$  topologies. The trivial case does not fit the idea in the demonstration; because if  $Y \subseteq X$  then  $\text{IncludedSet } (Y \cap X) \ (Y \cap T)$  is never trivial. There is no need of a separate proof because the only subspace of the trivial topology is itself.

```
lemma subspace_includedset:
  assumes  $T \subseteq X$ 
  shows (IncludedSet X T) {restricted to} Y=(IncludedSet (Y  $\cap$  X) (Y $\cap$ T))
proof
  {
    fix M
    assume  $M \in ((\text{IncludedSet } X \ T) \text{ {restricted to} } Y)$ 
    then obtain A where  $A1:A:(\text{IncludedSet } X \ T) \ M=Y \cap A$  unfolding RestrictedTo_def
  by auto
    then have  $M \in \text{Pow}(X \cap Y)$  unfolding IncludedSet_def by auto
    moreover
    from A1 have  $Y \cap T \subseteq M \vee M=0$  unfolding IncludedSet_def by blast
    ultimately have  $M \in (\text{IncludedSet } (Y \cap X) \ (Y \cap T))$  unfolding IncludedSet_def
      by auto
  }
  then show (IncludedSet X T) {restricted to} Y  $\subseteq$  (IncludedSet (Y  $\cap$  X)
(Y $\cap$ T)) by auto
  {
    fix M
    let A=M  $\cup$  T
    assume  $A:M \in (\text{IncludedSet } (Y \cap X) \ (Y \cap T))$ 
    {
      assume  $M=0$ 
      then have  $M \in (\text{IncludedSet } X \ T) \text{ {restricted to} } Y$  unfolding RestrictedTo_def
        IncludedSet_def by auto
    }
    moreover
    {
```

```

      assume AS:M≠0
      from A AS have A1:(M∈Pow(Y ∩ X) ∧ Y ∩ T⊆M) unfolding IncludedSet_def
by auto
      then have A∈Pow(X) using assms by blast
      moreover
      have T⊆A by blast
      ultimately have A∈(IncludedSet X T) unfolding IncludedSet_def by
auto
      then have AT:Y ∩ A∈(IncludedSet X T) {restricted to} Yunfolding
RestrictedTo_def
      by auto
      from A1 have Y ∩ A=Y ∩ M by blast
      also with A1 have ...=M by auto
      finally have Y ∩ A=M.
      with AT have M∈(IncludedSet X T) {restricted to} Y
      by auto
    }
    ultimately have M∈(IncludedSet X T) {restricted to} Y by auto
  }
  thus (IncludedSet (Y ∩ X) (Y ∩ T)) ⊆ (IncludedSet X T) {restricted
to} Y by auto
qed

end

```

## 58 Topology\_ZF\_examples\_1.thy

```
theory Topology_ZF_examples_1
imports Topology_ZF_1 Order_ZF
begin
```

In this theory file we reformulate the concepts related to a topology in relation with a base of the topology and we give examples of topologies defined by bases or subbases.

### 58.1 New ideas using a base for a topology

#### 58.1.1 The topology of a base

Given a family of subsets satisfying the base condition, it is possible to construct a topology where that family is a base. Even more, it is the only topology with such characteristics.

**definition**

```
TopologyWithBase (TopologyBase _ 50) where
  U {satisfies the base condition}  $\implies$  TopologyBase U  $\equiv$  THE T. U {is a
base for} T
```

**theorem** Base\_topology\_is\_a\_topology:

```
  assumes U {satisfies the base condition}
  shows (TopologyBase U) {is a topology} and U {is a base for} (TopologyBase
U)
```

**proof-**

```
  from assms obtain T where U {is a base for} T using
    Top_1_2_T1(2) by blast
  then have  $\exists!$ T. U {is a base for} T using same_base_same_top ex1I[where
P=
   $\lambda$ T. U {is a base for} T] by blast
  with assms show U {is a base for} (TopologyBase U) using theI[where
P=
   $\lambda$ T. U {is a base for} T] TopologyWithBase_def by auto
  with assms show (TopologyBase U) {is a topology} using Top_1_2_T1(1)
    IsABaseFor_def by auto
qed
```

A base doesn't need the empty set.

**lemma** base\_no\_0:

```
  shows B{is a base for}T  $\longleftrightarrow$  (B-{0}){is a base for}T
proof-
```

```
{
  fix M
  assume  $M \in \{\bigcup A \mid A \in \text{Pow}(B)\}$ 
  then obtain Q where  $M = \bigcup Q$   $Q \in \text{Pow}(B)$  by auto
  hence  $M = \bigcup (Q - \{0\})$   $Q - \{0\} \in \text{Pow}(B - \{0\})$  by auto
```

```

    hence  $M \in \{\bigcup A . A \in \text{Pow}(B - \{0\})\}$  by auto
  }
  hence  $\{\bigcup A . A \in \text{Pow}(B)\} \subseteq \{\bigcup A . A \in \text{Pow}(B - \{0\})\}$  by blast
  moreover
  {
    fix M
    assume  $M \in \{\bigcup A . A \in \text{Pow}(B - \{0\})\}$ 
    then obtain Q where  $M = \bigcup Q Q \in \text{Pow}(B - \{0\})$  by auto
    hence  $M = \bigcup (Q) Q \in \text{Pow}(B)$  by auto
    hence  $M \in \{\bigcup A . A \in \text{Pow}(B)\}$  by auto
  }
  hence  $\{\bigcup A . A \in \text{Pow}(B - \{0\})\} \subseteq \{\bigcup A . A \in \text{Pow}(B)\}$ 
    by auto
  ultimately have  $\{\bigcup A . A \in \text{Pow}(B - \{0\})\} = \{\bigcup A . A \in \text{Pow}(B)\}$  by auto
  then show  $B\{\text{is a base for}\}T \longleftrightarrow (B - \{0\})\{\text{is a base for}\}T$  using IsAbaseFor_def
by auto
qed

```

The interior of a set is the union of all the sets of the base which are fully contained by it.

```

lemma interior_set_base_topology:
  assumes U {is a base for} TT{is a topology}
  shows  $\text{Interior}(A, T) = \bigcup \{T \in U. T \subseteq A\}$ 
proof
  have  $\{T \in U. T \subseteq A\} \subseteq U$  by auto
  with assms(1) have  $\bigcup \{T \in U. T \subseteq A\} \in T$ 
    using IsAbaseFor_def by auto
  moreover
  have  $\bigcup \{T \in U. T \subseteq A\} \subseteq A$  by blast
  with calculation assms(2) show  $\bigcup \{T \in U. T \subseteq A\} \subseteq \text{Interior}(A, T)$ 
    using topology0.Top_2_L5 topology0_def by auto
  {
    fix x
    assume  $x \in \text{Interior}(A, T)$ 
    with assms obtain V where  $V \in UV \subseteq \text{Interior}(A, T) x \in V$ 
      using point_open_base_neigh
      topology0.Top_2_L2 topology0_def by blast
    with assms have  $V \in U x \in VV \subseteq A$  using topology0.Top_2_L1 topology0_def
      by (safe, blast)
    hence  $x \in \bigcup \{T \in U. T \subseteq A\}$  by auto
  }
  thus  $\text{Interior}(A, T) \subseteq \bigcup \{T \in U . T \subseteq A\}$  by auto
qed

```

In the following, we offer another lemma about the closure of a set given a basis for a topology. This lemma is based on `cl_inter_neigh` and `inter_neigh_cl`. It states that it is only necessary to check the sets of the base, not all the open sets.

```

lemma closure_set_base_topology:

```

```

assumes U {is a base for} QQ{is a topology}  $A \subseteq \bigcup Q$ 
shows Closure(A,Q) =  $\{x \in \bigcup Q. \forall T \in U. x \in T \longrightarrow A \cap T \neq \emptyset\}$ 
proof
{
  fix x
  assume A:  $x \in \text{Closure}(A,Q)$ 
  with assms(2,3) have B:  $x \in \bigcup Q$  using topology0_def topology0.Top_3_L11(1)
  by blast
  moreover
  {
    fix T
    assume T:  $x \in T$ 
    with assms(1) have TQ:  $x \in T$  using base_sets_open
    by auto
    with assms(2,3) A have AT:  $A \cap T \neq \emptyset$  using topology0_def
      topology0.cl_inter_neigh[where U=T and T=Q and A=A]
    by auto
  }
  hence VTU:  $\forall T \in U. x \in T \longrightarrow A \cap T \neq \emptyset$  by auto
  ultimately have xBUQ:  $x \in \{x \in \bigcup Q. \forall T \in U. x \in T \longrightarrow A \cap T \neq \emptyset\}$  by auto
}
thus Closure(A, Q)  $\subseteq \{x \in \bigcup Q. \forall T \in U. x \in T \longrightarrow A \cap T \neq \emptyset\}$ 
  by auto
{
  fix x
  assume AS:  $x \in \{x \in \bigcup Q. \forall T \in U. x \in T \longrightarrow A \cap T \neq \emptyset\}$ 
  hence xBUQ by blast
  moreover
  {
    fix R
    assume R:  $x \in R$ 
    with assms(1) obtain W where RR:  $W \subseteq R$  using
      IsABaseFor_def by auto
    {
      assume xR:  $x \in R$

qed

```

## 58.2 Partition topology

In the theory file `Partitions_ZF.thy`; there is a definition to work with partitions. In this setting is much easier to work with a family of subsets.

**definition**

`IsAPartition` ( $\_ \{ \text{is a partition of} \} \_ 90$ ) **where**  
 $(U \{ \text{is a partition of} \} X) \equiv (\bigcup U = X \wedge (\forall A \in U. \forall B \in U. A = B \vee A \cap B = \emptyset) \wedge \emptyset \notin U)$

A subcollection of a partition is a partition of its union.

**lemma** `subpartition`:

assumes  $U \{ \text{is a partition of} \} X \wedge V \subseteq U$   
 shows  $V \{ \text{is a partition of} \} \bigcup V$   
 using assms **unfolding** `IsAPartition_def` **by** auto

A restriction of a partition is a partition. If the empty set appears it has to be removed.

**lemma** `restriction_partition`:

assumes  $U \{ \text{is a partition of} \} X$   
 shows  $((U \{ \text{restricted to} \} Y) - \{\emptyset\}) \{ \text{is a partition of} \} (X \cap Y)$   
 using assms **unfolding** `IsAPartition_def` `RestrictedTo_def`  
**by** fast

Given a partition, the complement of a union of a subfamily is a union of a subfamily.

**lemma** `diff_union_is_union_diff`:

assumes  $R \subseteq P \{ \text{is a partition of} \} X$   
 shows  $X - \bigcup R = \bigcup (P - R)$

**proof**

```

{
  fix x
  assume  $x \in X - \bigcup R$ 
  hence  $P : x \in X \wedge x \notin \bigcup R$  by auto
  {
    fix T
    assume  $T \in R$ 
    with P(2) have  $x \notin T$  by auto
  }
}

```

```

    with P(1) assms(2) obtain Q where  $Q \in (P-R)x \in Q$  using IsAPartition_def
  by auto
    hence  $x \in \bigcup (P-R)$  by auto
  }
  thus  $X - \bigcup R \subseteq \bigcup (P-R)$  by auto
  {
    fix x
    assume  $x \in \bigcup (P-R)$ 
    then obtain Q where  $Q \in P-Rx \in Q$  by auto
    hence C:  $Q \in P \land Q \notin R$  by auto
    then have  $x \in \bigcup P$  by auto
    with assms(2) have  $x \in X$  using IsAPartition_def by auto
    moreover
    {
      assume  $x \in \bigcup R$ 
      then obtain t where  $G:t \in R \ x \in t$  by auto
      with C(3) assms(1) have  $t \cap Q \neq \emptyset$  by auto
      with assms(2) C(1,3) have  $t=Q$  using IsAPartition_def
      by blast
      with C(2) G(1) have False by auto
    }
    hence  $x \notin \bigcup R$  by auto
    ultimately have  $x \in X - \bigcup R$  by auto
  }
  thus  $\bigcup (P-R) \subseteq X - \bigcup R$  by auto
qed

```

### 58.2.1 Partition topology is a topology.

A partition satisfies the base condition.

```

lemma partition_base_condition:
  assumes P {is a partition of} X
  shows P {satisfies the base condition}
proof-
  {
    fix U V
    assume AS:  $U \in P \wedge V \in P$ 
    with assms have A:  $U=V \vee U \cap V = \emptyset$  using IsAPartition_def by auto
    {
      fix x
      assume ASS:  $x \in U \cap V$ 
      with A have  $U=V$  by auto
      with AS ASS have  $U \in P \wedge x \in U \wedge U \subseteq U \cap V$  by auto
      hence  $\exists W \in P. x \in W \wedge W \subseteq U \cap V$  by auto
    }
    hence  $(\forall x \in U \cap V. \exists W \in P. x \in W \wedge W \subseteq U \cap V)$  by auto
  }
  then show thesis using SatisfiesBaseCondition_def by auto
qed

```

Since a partition is a base of a topology, and this topology is uniquely determined; we can build it. In the definition we have to make sure that we have a partition.

**definition**

```
PartitionTopology (PTopology _ _ 50) where
  (U {is a partition of} X)  $\implies$  PTopology X U  $\equiv$  TopologyBase U
```

**theorem** Ptopology\_is\_a\_topology:

```
  assumes U {is a partition of} X
  shows (PTopology X U) {is a topology} and U {is a base for} (PTopology X U)
  using assms Base_topology_is_a_topology partition_base_condition
    PartitionTopology_def by auto
```

**lemma** topology0\_ptopology:

```
  assumes U {is a partition of} X
  shows topology0(PTopology X U)
  using Ptopology_is_a_topology topology0_def assms by auto
```

### 58.2.2 Total set, Closed sets, Interior, Closure and Boundary

The topology is defined in the set  $X$

**lemma** union\_ptopology:

```
  assumes U {is a partition of} X
  shows  $\bigcup$  (PTopology X U)=X
  using assms Ptopology_is_a_topology(2) Top_1_2_L5
    IsAPartition_def by auto
```

The closed sets are the open sets.

**lemma** closed\_sets\_ptopology:

```
  assumes T {is a partition of} X
  showsD {is closed in} (PTopology X T)  $\longleftrightarrow$  D $\in$ (PTopology X T)
```

**proof**

```
  from assms
  have B:T{is a base for}(PTopology X T) using Ptopology_is_a_topology(2)
  by auto
  {
    fix D
    assume D {is closed in} (PTopology X T)

### 58.3 Order topologies

#### 58.3.1 Order topology is a topology

Given a totally ordered set, several topologies can be defined using the order relation. First we define an open interval, notice that the set defined as Interval is a closed interval; and open rays.

**definition**

IntervalX where  
IntervalX(X,r,b,c)≡(Interval(r,b,c)∩X)-{b,c}

**definition**

LeftRayX where  
LeftRayX(X,r,b)≡{c∈X. ⟨c,b⟩∈r}-{b}

**definition**

RightRayX where  
RightRayX(X,r,b)≡{c∈X. ⟨b,c⟩∈r}-{b}

Intersections of intervals and rays.

**lemma inter\_two\_intervals:**

```
  assumes bu∈Xbv∈Xcu∈Xcv∈XIsLinOrder(X,r)
  shows IntervalX(X,r,bu,cu)∩IntervalX(X,r,bv,cv)=IntervalX(X,r,GreaterOf(r,bu,bv),SmallerOf(bv,bu))
proof
```

```

qed

```

The interior, closure and boundary can be calculated using the formulas proved in the section that deals with the base.

The subspace of an order topology doesn't have to be an order topology.

### 58.3.3 Right order and Left order topologies.

Notice that the left and right rays are closed under intersection, hence they form a base of a topology. They are called right order topology and left order topology respectively.

If the order in  $X$  has a minimal or a maximal element, is necessary to consider  $X$  as an element of the base or that limit point wouldn't be in any basic open set.

### 58.3.4 Right and Left Order topologies are topologies

```

unfolding LeftRayX_def RightRayX_def by auto

```

## 58.4 Union of Topologies

The union of two topologies is not a topology. A way to overcome this fact is to define the following topology:

**definition**

```

joinT (joinT _ 90) where
  ( $\forall T \in M. T \text{ is a topology} \wedge (\forall Q \in M. \bigcup Q = \bigcup T) \implies (\text{joinT } M \equiv \text{THE } T. (\bigcup M) \text{ is a subbase for } T)$ )

```

First let's proof that given a family of sets, then it is a subbase for a topology.

The first result states that from any family of sets we get a base using finite intersections of them. The second one states that any family of sets is a subbase of some topology.

**theorem subset\_as\_subbase:**

```

shows  $\{\bigcap A. A \in \text{FinPow}(B)\} \text{ satisfies the base condition}$ 

```

**proof-**

```

{
  fix U V
  assume A:  $U \in \{\bigcap A. A \in \text{FinPow}(B)\} \wedge V \in \{\bigcap A. A \in \text{FinPow}(B)\}$ 
  then obtain M R where MR:  $\text{Finite}(M) \text{Finite}(R) M \subseteq B R \subseteq B$ 
  U =  $\bigcap M V = \bigcap R$ 
  using FinPow_def by auto

## 59 Topology\_ZF\_properties.thy

theory Topology\_ZF\_properties imports Topology\_ZF\_examples Topology\_ZF\_examples\_1

begin

This theory deals with topological properties which make use of cardinals.

### 59.1 Properties of compactness

It is already defined what is a compact topological space, but there is a generalization which may be useful sometimes.

**definition**

```
IsCompactOfCard (_{is compact of cardinal}_ {in}_ 90)
where K{is compact of cardinal} Q{in}T  $\equiv$  (Card(Q)  $\wedge$   $K \subseteq \bigcup T$   $\wedge$ 
 $(\forall M \in \text{Pow}(T). K \subseteq \bigcup M \longrightarrow (\exists N \in \text{Pow}(M). K \subseteq \bigcup N \wedge N \prec Q))$ )
```

The usual compact property is the one defined over the cardinal of the natural numbers.

**lemma** Compact\_is\_card\_nat:

shows  $K\{\text{is compact in}\}T \longleftrightarrow (K\{\text{is compact of cardinal}\} \text{ nat } \{in\}T)$

**proof**

```
{
  assume K{is compact in}T
  then have sub:  $K \subseteq \bigcup T$  and reg:  $(\forall M \in \text{Pow}(T). K \subseteq \bigcup M \longrightarrow (\exists N \in \text{FinPow}(M). K \subseteq \bigcup N))$ 
  using IsCompact_def by auto
  {
    fix M
    assume  $M \in \text{Pow}(T) \wedge K \subseteq \bigcup M$ 
    with reg obtain N where  $N \in \text{FinPow}(M) \wedge K \subseteq \bigcup N$  by blast
    then have Finite(N) using FinPow_def by auto
    then obtain n where  $A: n \in \text{nat} \wedge N \approx n$  using Finite_def by auto
    from A(1) have  $n \prec \text{nat}$  using n_lesspoll_nat by auto
    with A(2) have  $N \lesssim \text{nat}$  using lesspoll_def eq_lepoll_trans by auto
    moreover
    {
      assume  $N \approx \text{nat}$ 
      then have  $\text{nat} \approx N$  using eqpoll_sym by auto
      with A(2) have  $\text{nat} \approx n$  using eqpoll_trans by blast
      then have  $n \approx \text{nat}$  using eqpoll_sym by auto
      with ' $n \prec \text{nat}$ ' have False using lesspoll_def by auto
    }
    then have  $\sim(N \approx \text{nat})$  by auto
    with calculation ' $K \subseteq \bigcup N$ ' ' $N \in \text{FinPow}(M)$ ' have  $N \prec \text{nat} \wedge K \subseteq \bigcup N$  by auto
  }
  using lesspoll_def
  FinPow_def by auto
  hence  $(\exists N \in \text{Pow}(M). K \subseteq \bigcup N \wedge N \prec \text{nat})$  by auto
```

```

    }
    with sub show K{is compact of cardinal} nat {in}T using IsCompactOfCard_def
Card_nat by auto
  }
  {
    assume (K{is compact of cardinal} nat {in}T)
    then have sub:K $\subseteq$ U T and reg:( $\forall$  M $\in$ Pow(T). K  $\subseteq$  U M  $\longrightarrow$  ( $\exists$  N  $\in$  Pow(M).
K  $\subseteq$  U N  $\wedge$  N $\prec$ nat))
    using IsCompactOfCard_def by auto
    {
      fix M
      assume M $\in$ Pow(T)K $\subseteq$ U M
      with reg have ( $\exists$  N  $\in$  Pow(M). K  $\subseteq$  U N  $\wedge$  N $\prec$ nat) by auto
      then obtain N where N $\in$ Pow(M)K $\subseteq$ U N N $\prec$ nat by blast
      then have N $\in$ FinPow(M)K $\subseteq$ U N using lesspoll_nat_is_Finite FinPow_def
    by auto
    hence  $\exists$ N $\in$ FinPow(M). K $\subseteq$ U N by auto
  }
  with sub show K{is compact in}T using IsCompact_def by auto
}
qed

```

Another property of this kind widely used is the Lindelof property; it is the one on the successor of the natural numbers.

**definition**

```

IsLindelof (_{is lindelof in}_ 90) where
K {is lindelof in} T $\equiv$ K{is compact of cardinal}csucc(nat){in}T

```

It would be natural to think that every countable set with any topology is Lindelof; but this statement is not provable in ZF. The reason is that to build a subcover, most of the time we need to *choose* sets from an infinite collection which cannot be done in ZF. Additional axioms are needed, but strictly weaker than the axiom of choice.

However, if the topology has not many open sets, then the topological space is indeed compact.

**theorem card\_top\_comp:**

```

  assumes Card(Q) T $\prec$ Q K $\subseteq$ U T
  shows (K){is compact of cardinal}Q{in}T
proof-
  {
    fix M assume M:M $\subseteq$ T K $\subseteq$ U M

### 59.2.1 Relations between numerability properties and choice principles

It is known that some statements in topology aren't just derived from choice axioms, but also equivalent to them. Here is an example

The following are equivalent:

- Every topological space of second cardinality  $\text{csucc}(Q)$  is separable of cardinality  $\text{csucc}(Q)$ .
- The axiom of  $Q$  choice.

In the article [4] there is a proof of this statement for  $Q = \mathbb{N}$ , with more equivalences.

If a topology is of second type of cardinal  $\text{csucc}(Q)$ , then it is separable of the same cardinal. This result makes use of the axiom of choice for the cardinal  $Q$  on subsets of  $\bigcup T$ .

```

theorem Q_choice_imp_second_imp_separable:
  assumes T{is of second type of cardinal}csucc(Q)
    and {the axiom of} Q {choice holds for subsets}  $\bigcup T$ 
    and T{is a topology}
  shows T{is separable of cardinal}csucc(Q)

This results make easy to check if a space is  $T_2$ .

The topology which comes from a filter as in  $\mathfrak{F} \{ \text{is a filter on} \} \bigcup \mathfrak{F} \implies (\mathfrak{F} \cup \{0\}) \{ \text{is a topology} \}$  is not  $T_2$  generally. We will see in this file later on, that the exceptions are a consequence of the spectrum.

```

## 60.2 Spectrum and anti-properties

The spectrum of a topological property is a class of sets such that all topologies defined over that set have that property.

The spectrum of a property gives us the list of sets for which the property doesn't give any topological information. Being in the spectrum of a topological property is an invariant in the category of sets and function; meaning that equipollent sets are in the same spectra.

**definition**  $\text{Spec } (\_ \text{ \{is in the spectrum of\} } \_ \ 99)$   
**where**  $\text{Spec}(K,P) \equiv \forall T. ((T\{\text{is a topology}\} \wedge \bigcup T \approx K) \longrightarrow P(T))$

**lemma**  $\text{equipollent\_spect}$ :  
**assumes**  $A \approx B$   $B \{\text{is in the spectrum of}\} P$   
**shows**  $A \{\text{is in the spectrum of}\} P$   
**proof-**  
**from**  $\text{assms}(2)$  **have**  $\forall T. ((T\{\text{is a topology}\} \wedge \bigcup T \approx B) \longrightarrow P(T))$  **using**  $\text{Spec\_def}$  **by**  $\text{auto}$   
**then have**  $\forall T. ((T\{\text{is a topology}\} \wedge \bigcup T \approx A) \longrightarrow P(T))$  **using**  $\text{eqpoll\_trans}[OF \_ \text{assms}(1)]$  **by**  $\text{auto}$   
**then show**  $\text{thesis}$  **using**  $\text{Spec\_def}$  **by**  $\text{auto}$   
**qed**

**theorem**  $\text{eqpoll\_iff\_spec}$ :  
**assumes**  $A \approx B$   
**shows**  $(B \{\text{is in the spectrum of}\} P) \longleftrightarrow (A \{\text{is in the spectrum of}\} P)$   
**proof**  
**assume**  $B \{\text{is in the spectrum of}\} P$   
**with**  $\text{assms}$   $\text{equipollent\_spect}$  **show**  $A \{\text{is in the spectrum of}\} P$  **by**  $\text{auto}$   
**next**  
**assume**  $A \{\text{is in the spectrum of}\} P$   
**moreover**  
**from**  $\text{assms}$  **have**  $B \approx A$  **using**  $\text{eqpoll\_sym}$  **by**  $\text{auto}$   
**ultimately show**  $B \{\text{is in the spectrum of}\} P$  **using**  $\text{equipollent\_spect}$  **by**  $\text{auto}$   
**qed**

From the previous statement, we see that the spectrum could be formed only by representative of classes of sets. If  $AC$  holds, this means that the spectrum can be taken as a set or class of cardinal numbers.

Here is an example of the spectrum. The proof lies in the indiscrete filter  $\{A\}$  that can be build for any set. In this proof, we see that without choice, there is no way to define the spectrum of a property with cardinals because if a set is not comparable with any ordinal, its cardinal is defined as 0 without the set being empty.

**theorem**  $\text{T4\_spectrum}$ :

```

```

This last theorem states that if one of the forms of the axiom of choice related to this compactness property fails, then the spectrum will be different. Notice that even for Lindelöf spaces that will happen.

The spectrum gives us the possibility to define what an anti-property means. A space is anti-P if the only subspaces which have the property are the ones in the spectrum of P. This concept tries to put together spaces that are completely opposite to spaces where  $P(T)$ .

#### definition

```

antiProperty ( $\_ \{\text{is anti-}\} \_ 50$ )
  where  $T \{\text{is anti-}\} P \equiv \forall A \in Pow(\bigcup T). P(T \{\text{restricted to}\} A) \longrightarrow (A \{\text{is in the spectrum of}\} P)$ 

```

#### abbreviation

```

ANTI(P)  $\equiv \lambda T. (T \{\text{is anti-}\} P)$ 

```

A first, very simple, but very useful result is the following: when the properties are related and the spectra are equal, then the anti-properties are related in the opposite direction.

#### theorem (in topology0) eq\_spect\_rev\_imp\_anti:

```

```

The conclusion is that being  $T_0$  is just the opposite to being indiscrete.

Next, let's compute the anti- $T_i$  for  $i = 1, 2, 3$  or  $4$ . Surprisingly, they are all the same. Meaning, that the total negation of  $T_1$  is enough to negate all of these axioms.

**theorem anti\_T1:**

  by auto
qed

```

In conclusion,  $T_1$  is also an anti-property.

Let's define some anti-properties that we'll use in the future.

**definition**

```

IsAntiComp (_{is anti-compact})
where  $T\{\text{is anti-compact}\} \equiv T\{\text{is anti-}\}(\lambda T. (\bigcup T)\{\text{is compact in}\}T)$ 

```

**definition**

```

IsAntiLin (_{is anti-lindeloeff})
where  $T\{\text{is anti-lindeloeff}\} \equiv T\{\text{is anti-}\}(\lambda T. ((\bigcup T)\{\text{is lindeloeff in}\}T))$ 

```

Anti-compact spaces are also called pseudo-finite spaces in literature before the concept of anti-property was defined.

**end**

## 61 Topology\_ZF\_6.thy

```
theory Topology_ZF_6 imports Topology_ZF_4 Topology_ZF_2 Topology_ZF_1
```

```
begin
```

This theory deals with the relations between continuous functions and convergence of filters. At the end of the file there some results about the building of functions in cartesian products.

### 61.1 Image filter

First of all, we will define the appropriate tools to work with functions and filters together.

We define the image filter as the collections of supersets of of images of sets from a filter.

**definition**

```
ImageFilter (_[_]... 98)
  where  $\mathfrak{F}$  {is a filter on}  $X \implies f:X \rightarrow Y \implies f[\mathfrak{F}]..Y \equiv \{A \in \text{Pow}(Y). \exists D \in \{f(B) . B \in \mathfrak{F}\}. D \subseteq A\}$ 
```

Note that in the previous definition, it is necessary to state  $Y$  as the final set because  $f$  is also a function to every superset of its range.  $X$  can be changed by  $\text{domain}(f)$  without any change in the definition.

**lemma base\_image\_filter:**

```
  assumes  $\mathfrak{F}$  {is a filter on}  $X$   $f:X \rightarrow Y$ 
  shows  $\{fB . B \in \mathfrak{F}\}$  {is a base filter}  $(f[\mathfrak{F}]..Y)$  and  $(f[\mathfrak{F}]..Y)$  {is a filter on}  $Y$ 
```

**proof-**

```
{
  assume  $0 \in \{fB . B \in \mathfrak{F}\}$ 
  then obtain B where  $B \in \mathfrak{F}$  and  $f_B:fB=0$  by auto
  then have  $B \in \text{Pow}(X)$  using assms(1) IsFilter_def by auto

## 61.2 Continuous at a point vs. globally continuous

In this section we show that continuity of a function implies local continuity (at a point) and that local continuity at all points implies (global) continuity.

If a function is continuous, then it is continuous at every point.

```

lemma cont_global_imp_continuous_x:
  assumes  $x \in \bigcup \tau_1$  IsContinuous( $\tau_1, \tau_2, f$ )  $f: (\bigcup \tau_1) \rightarrow (\bigcup \tau_2)$   $x \in \bigcup \tau_1$ 
  shows  $\forall U \in \tau_2. f(x) \in U \longrightarrow (\exists V \in \tau_1. x \in V \wedge f(V) \subseteq U)$ 
proof-
  {
    fix U
    assume AS:  $U \in \tau_2$   $f(x) \in U$ 
    then have  $f^{-1}(U) \in \tau_1$  using assms(2) IsContinuous_def by auto
    moreover
    from assms(3) have  $f(f^{-1}(U)) \subseteq U$  using function_image_vimage fun_is_fun

    by auto
    moreover
    from assms(3) assms(4) AS(2) have  $x \in f^{-1}(U)$  using func1_1_L15 by auto
    ultimately have  $\exists V \in \tau_1. x \in V \wedge fV \subseteq U$  by auto
  }
  then show  $\forall U \in \tau_2. f(x) \in U \longrightarrow (\exists V \in \tau_1. x \in V \wedge f(V) \subseteq U)$  by auto
qed

```

A function that is continuous at every point of its domain is continuous.

```

lemma ccontinuous_all_x_imp_cont_global:
  assumes  $\forall x \in \bigcup \tau_1. \forall U \in \tau_2. fx \in U \longrightarrow (\exists V \in \tau_1. x \in V \wedge fV \subseteq U)$   $f \in (\bigcup \tau_1) \rightarrow (\bigcup \tau_2)$ 
  and
     $\tau_1$  {is a topology}
  shows IsContinuous( $\tau_1, \tau_2, f$ )
proof-
  {
    fix U
    assume  $U \in \tau_2$ 
    {
      fix x
      assume AS:  $x \in f^{-1}U$ 
      note ' $U \in \tau_2$ '
      moreover
      from assms(2) have  $f^{-1}U \subseteq \bigcup \tau_1$  using func1_1_L6A by auto
      with AS have  $x \in \bigcup \tau_1$  by auto

### 61.3 Continuous functions and filters

In this section we consider the relations between filters and continuity.

If the function is continuous then if the filter converges to a point the image filter converges to the image point.

```

lemma (in two_top_spaces0) cont_imp_filter_conver_preserved:
  assumes  $\mathfrak{F}$  {is a filter on}  $X_1$  f {is continuous}  $\mathfrak{F} \rightarrow_F x$  {in}  $\tau_1$ 
  shows  $(f[\mathfrak{F}]..X_2) \rightarrow_F (f(x))$  {in}  $\tau_2$

### 62.1 Connection Properties

Another type of topological properties are the connection properties. These properties establish if the space is formed of several pieces or just one.

A space is connected iff there is no clopen set other than the empty set and the total set.

```
definition IsConnected (_{is connected} 70)
  where T {is connected}  $\equiv \forall U. (U \in T \wedge (U \text{ {is closed in } } T)) \longrightarrow U = \emptyset \vee U = \bigcup T$ 
```

```
lemma indiscrete_connected:
  shows {0,X} {is connected}
  unfolding IsConnected_def IsClosed_def by auto
```

The anti-property of connectedness is called total-disconnectedness.

```
definition IsTotDis (_ {is totally-disconnected} 70)
  where IsTotDis  $\equiv \text{ANTI}(\text{IsConnected})$ 
```

```
lemma conn_spectrum:
  shows (A{is in the spectrum of}IsConnected)  $\longleftrightarrow A \lesssim 1$ 
```

**proof**

```

```

In the following results we will show that anti-hyperconnectedness is a separation property between  $T_1$  and  $T_2$ . We will show also that both implications are proper.

First, the closure of a point in every topological space is always hyperconnected. This is the reason why every anti-hyperconnected space must be  $T_1$ : every singleton must be closed.

**lemma** (in topology0) cl\_point\_imp\_HConn:  
 assumes  $x \in \bigcup T$

```

```

In the literature, there exists a class of spaces called sober spaces; where the only non-empty closed hyperconnected subspaces are the closures of points and closures of different singletons are different.

**definition** IsSober ( $\_ \{\text{is sober}\}90$ )

where  $T\{\text{is sober}\} \equiv \forall A \in \text{Pow}(\bigcup T) - \{0\}. (A\{\text{is closed in}\}T \wedge ((T\{\text{restricted to}\}A)\{\text{is hyperconnected}\})) \longrightarrow (\exists x \in \bigcup T. A = \text{Closure}(\{x\}, T) \wedge (\forall y \in \bigcup T. A = \text{Closure}(\{y\}, T) \longrightarrow y = x))$

Being sober is weaker than being anti-hyperconnected.

**theorem** (in topology0) anti\_HConn\_imp\_sober:

assumes  $T\{\text{is anti-}\}\text{IsHConnected}$

shows  $T\{\text{is sober}\}$

**proof-**

```

{
  fix A assume  $A \in \text{Pow}(\bigcup T) - \{0\}$   $A\{\text{is closed in}\}T$   $(T\{\text{restricted to}\}A)\{\text{is hyperconnected}\}$

Let's show that anti-hyperconnected is in fact  $T_1$  and sober. The trick of the proof lies in the fact that if a subset is hyperconnected, its closure is so too (the closure of a point is then always hyperconnected because singletons are in the spectrum); since the closure is closed, we can apply the sober property on it.

**theorem** (in topology0)  $T_1$ \_sober\_imp\_anti\_HConn:

```

## 63 Topology\_ZF\_8.thy

```
theory Topology_ZF_8 imports Topology_ZF_6 EquivClass1
begin
```

This theory deals with quotient topologies.

### 63.1 Definition of quotient topology

Given a surjective function  $f : X \rightarrow Y$  and a topology  $\tau$  in  $X$ , it is possible to consider a special topology in  $Y$ .  $f$  is called quotient function.

```
definition(in topology0)
  QuotientTop ({quotient topology in}_{by}_ 80)
  where f $\in$ surj( $\bigcup T, Y$ )  $\implies$ {quotient topology in} $\{Y\}$ {by} $\{f \equiv$ 
     $\{U \in \text{Pow}(Y) . f - U \in T\}$ 
```

```
abbreviation QuotientTopTop ({quotient topology in}_{by}_{from}_)
  where QuotientTopTop(Y,f,T)  $\equiv$  topology0.QuotientTop(T,Y,f)
```

The quotient topology is indeed a topology.

```
theorem(in topology0) quotientTop_is_top:
  assumes f $\in$ surj( $\bigcup T, Y$ )
  shows ({quotient topology in} Y {by} f) {is a topology}
proof-

```

Now we define what a quotient topology from an equivalence relation is:

```

definition(in topology0)
  EquivQuo ({quotient by}_ 70)
  where equiv( $\bigcup T, r$ )  $\implies$  ({quotient by} $r$ )  $\equiv$  {quotient topology in}( $\bigcup T$ )// $r$ {by}{ $\langle b, r\{b\} \rangle. b \in \bigcup T$ }

```

abbreviation

```

  EquivQuoTop (_{quotient by}_ 60)
  where EquivQuoTop( $T, r$ )  $\equiv$  topology0.EquivQuo( $T, r$ )

```

First, another description of the topology (more intuitive):

```

theorem (in topology0) quotient_equiv_rel:
  assumes equiv( $\bigcup T, r$ )
  shows ({quotient by} $r$ ) =  $\{U \in \text{Pow}((\bigcup T)//r). \bigcup U \in T\}$ 
proof-
  have ({quotient topology in}( $\bigcup T$ )// $r$ {by}{ $\langle b, r\{b\} \rangle. b \in \bigcup T$ }) =  $\{U \in \text{Pow}((\bigcup T)//r). \bigcup U \in T\}$ 
  { $\langle b, r\{b\} \rangle. b \in \bigcup T\} - U \in T$ 
    using QuotientTop_def quotient_proj_surj by auto moreover
  have  $\{U \in \text{Pow}((\bigcup T)//r). \{\langle b, r\{b\} \rangle. b \in \bigcup T\} - U \in T\} = \{U \in \text{Pow}((\bigcup T)//r). \bigcup U \in T\}$ 
  proof
    {
      fix U assume  $U \in \{U \in \text{Pow}((\bigcup T)//r). \{\langle b, r\{b\} \rangle. b \in \bigcup T\} - U \in T\}$ 
      then have  $U \in \{U \in \text{Pow}((\bigcup T)//r). \bigcup U \in T\}$  using preim_equi_proj assms
    by auto
    }
    then show  $\{U \in \text{Pow}((\bigcup T)//r). \{\langle b, r\{b\} \rangle. b \in \bigcup T\} - U \in T\} \subseteq \{U \in \text{Pow}((\bigcup T)//r). \bigcup U \in T\}$

  using quotientTop_is_top quotient_proj_surj EquivQuo_def assms by auto

MAIN RESULT: All quotient topologies arise from an equivalence relation
given by the quotient function  $f : X \rightarrow Y$ . This means that any quotient
topology is homeomorphic to a topology given by an equivalence relation
quotient.

theorem(in topology0) equiv_quotient_top:

### 64.1 Group of homeomorphisms

This theory file deals with the fact the set homeomorphisms of a topological space into itself forms a group.

First, we define the set of homeomorphisms.

**definition**

```
HomeoG(T)  $\equiv$  {f:  $\bigcup T \rightarrow \bigcup T$ . IsAhomeomorphism(T,T,f)}
```

The homeomorphisms are closed by composition.

**lemma** (in topology0) homeo\_composition:

```
assumes f $\in$ HomeoG(T) g $\in$ HomeoG(T)
shows Composition( $\bigcup T$ )<f, g> $\in$ HomeoG(T)
```

**proof-**

```
from assms have fun:f $\in$  $\bigcup T \rightarrow \bigcup T$  g $\in$  $\bigcup T \rightarrow \bigcup T$  and homeo:IsAhomeomorphism(T,T,f)IsAhomeomorphism(T,T,g)
unfolding HomeoG_def
by auto
from fun have f 0 g $\in$  $\bigcup T \rightarrow \bigcup T$  using comp_fun by auto moreover
from homeo have bij:f $\in$ bij( $\bigcup T$ , $\bigcup T$ ) g $\in$ bij( $\bigcup T$ , $\bigcup T$ ) and cont:IsContinuous(T,T,f)IsContinuous(T,T,g)
and contconv:
IsContinuous(T,T,converse(f))IsContinuous(T,T,converse(g)) unfolding
ing IsAhomeomorphism_def by auto
from bij have f 0 g $\in$ bij( $\bigcup T$ , $\bigcup T$ ) using comp_bij by auto moreover
from cont have IsContinuous(T,T,f 0 g) using comp_cont by auto moreover
over
have converse(f 0 g)=converse(g) 0 converse(f) using converse_comp by
auto
with contconv have IsContinuous(T,T,converse(f 0 g)) using comp_cont
by auto ultimately
have f 0 g $\in$ HomeoG(T) unfolding HomeoG_def IsAhomeomorphism_def by auto
then show thesis using func_ZF_5_L2 fun by auto
qed
```

The identity function is a homeomorphism.

**lemma** (in topology0) homeo\_id:

```
shows id( $\bigcup T$ ) $\in$ HomeoG(T)
```

**proof-**

```
have converse(id( $\bigcup T$ )) 0 id( $\bigcup T$ )=id( $\bigcup T$ ) using left_comp_inverse id_bij
by auto
then have converse(id( $\bigcup T$ ))=id( $\bigcup T$ ) using right_comp_id by auto
then show thesis unfolding HomeoG_def IsAhomeomorphism_def using id_cont

qed

```

Every continuous function from a space which has some property  $P$  and a space which has the property  $\text{anti}(P)$ , given that this property is preserved by continuous functions, it follows that the range of the function is in the spectrum. Applied to connectedness, it follows that continuous functions from a connected space to a totally-disconnected one are constant.

```

corollary(in two_top_spaces0) cont_conn_tot_disc:
  assumes IsContinuous( $\tau_1, \tau_2, f$ )  $\tau_1$ {is connected}  $\tau_2$ {is totally-disconnected}
   $f: X_1 \rightarrow X_2$   $X_1 \neq 0$ 
  shows  $\exists q \in X_2. \forall w \in X_1. f(w) = q$ 

```

proof-

## 66 Topology\_ZF\_11.thy

**theory** Topology\_ZF\_11 **imports** Topology\_ZF\_7 Finite\_ZF\_1

**begin**

This file deals with order topologies. The order topology is already defined in Topology\_ZF\_examples\_1.thy.

### 66.1 Order topologies

We will assume most of the time that the ordered set has more than one point. It is natural to think that the topological properties can be translated to properties of the order; since every order rises one and only one topology in a set.

#### 66.1.1 Separation properties

Order topologies have a lot of separation properties.

Every order topology is Hausdorff.

**theorem** order\_top\_T2:

**assumes** IsLinOrder(X,r)  $\exists x y. x \neq y \wedge x \in X \wedge y \in X$

**shows** (OrdTopology X r){is T<sub>2</sub>}

**proof-**

{

**fix** x y **assume** A1:  $x \in \bigcup (\text{OrdTopology } X \text{ } r) y \in \bigcup (\text{OrdTopology } X \text{ } r) x \neq y$   
**then have** AS:  $x \in X y \in X x \neq y$  **using** union\_ordtopology[OF assms(1) assms(2)]

**by auto**

Every order topology is  $T_4$ , but the proof needs lots of machinery. At the end of the file, we will prove that every order topology is normal; sooner or later.

## 66.2 Connectedness properties

Connectedness is related to two properties of orders: completeness and density

Some order-dense properties:

**definition**

IsDenseSub ( $\_ \{is\ dense\ in\ \_ \{with\ respect\ to\} \_ \}$ ) where  
 $A \{is\ dense\ in\ X \{with\ respect\ to\} r \equiv$   
 $\forall x \in X. \forall y \in X. \langle x, y \rangle \in r \wedge x \neq y \longrightarrow (\exists z \in A - \{x, y\}. \langle x, z \rangle \in r \wedge \langle z, y \rangle \in r)$

**definition**

IsDenseUnp ( $\_$  {is not-properly dense in} $\_$ {with respect to} $\_$ ) where  
 $A$  {is not-properly dense in} $X$ {with respect to} $r \equiv$   
 $\forall x \in X. \forall y \in X. \langle x, y \rangle \in r \wedge x \neq y \longrightarrow (\exists z \in A. \langle x, z \rangle \in r \wedge \langle z, y \rangle \in r)$

**definition**

IsWeaklyDenseSub ( $\_$  {is weakly dense in} $\_$ {with respect to} $\_$ ) where  
 $A$  {is weakly dense in} $X$ {with respect to} $r \equiv$   
 $\forall x \in X. \forall y \in X. \langle x, y \rangle \in r \wedge x \neq y \longrightarrow ((\exists z \in A - \{x, y\}. \langle x, z \rangle \in r \wedge \langle z, y \rangle \in r) \vee \text{IntervalX}(X, r, x, y) = 0)$

**definition**

IsDense ( $\_$  {is dense with respect to} $\_$ ) where  
 $X$  {is dense with respect to} $r \equiv$   
 $\forall x \in X. \forall y \in X. \langle x, y \rangle \in r \wedge x \neq y \longrightarrow (\exists z \in X - \{x, y\}. \langle x, z \rangle \in r \wedge \langle z, y \rangle \in r)$

**lemma dense\_sub:**

shows  $(X \text{ {is dense with respect to} } r) \longleftrightarrow (X \text{ {is dense in} } X \text{ {with respect to} } r)$

unfolding IsDenseSub\_def IsDense\_def by auto

**lemma not\_prop\_dense\_sub:**

shows  $(A \text{ {is dense in} } X \text{ {with respect to} } r) \longrightarrow (A \text{ {is not-properly dense in} } X \text{ {with respect to} } r)$

unfolding IsDenseSub\_def IsDenseUnp\_def by auto

In densely ordered sets, intervals are infinite.

**theorem dense\_order\_inf\_intervals:**

assumes IsLinOrder( $X, r$ ) IntervalX( $X, r, b, c$ )  $\neq 0$   $b \in X$   $c \in X$   $X$  {is dense with respect to} $r$

shows  $\neg \text{Finite}(\text{IntervalX}(X, r, b, c))$

**proof**

```

Actually a connected order topology is one that comes from a dense and complete order.

First a lemma. In a complete ordered set, every non-empty set bounded from below has a maximum lower bound.

```

lemma complete_order_bounded_below:
  assumes  $r \{ \text{is complete} \}$   $\text{IsBoundedBelow}(A, r)$   $A \neq 0$   $r \subseteq X \times X$ 
  shows  $\text{HasAmaximum}(r, \bigcap c \in A. r - \{c\})$ 

```

```

proof-
  let M= $\bigcap c \in A. r-\{c\}$ 
  from assms(3) obtain t where A:t $\in$ A by auto

### 66.3 Numerability axioms

A  $\kappa$ -separable order topology is in relation with order density.

If an order topology has a subset  $A$  which is topologically dense, then that subset is weakly order-dense in  $X$ .

**lemma**  $\text{dense\_top\_imp\_Wdense\_ord}$ :

**assumes**  $\text{IsLinOrder}(X, r)$   $\text{Closure}(A, \text{OrdTopology } X \ r) = X$   $A \subseteq X$   $\exists x \ y. x \neq y \wedge x \in X \wedge y \in X$

**shows**  $A \{ \text{is weakly dense in} \} X \{ \text{with respect to} \} r$

**proof-**

```

{
  fix  $r_1 \ r_2$  assume  $r_1 \in X \wedge r_2 \in X \wedge r_1 \neq r_2$   $\langle r_1, r_2 \rangle \in r$ 
  then have  $\text{IntervalX}(X, r, r_1, r_2) \in \{ \text{IntervalX}(X, r, b, c) \mid \langle b, c \rangle \in X \times X \} \cup \{ \text{LeftRayX}(X, r, b) \mid b \in X \} \cup$

```

Conversely, a weakly order-dense set is topologically dense if it is also considered that: if there is a maximum or a minimum elements whose singletons are open, this points have to be in  $A$ . In conclusion, weakly order-density is a property closed to topological density.

Another way to see this: Consider a weakly order-dense set  $A$ :

- If  $X$  has a maximum and a minimum and  $\{min, max\}$  is open:  $A$  is topologically dense in  $X \setminus \{min, max\}$ , where  $min$  is the minimum in  $X$  and  $max$  is the maximum in  $X$ .
- If  $X$  has a maximum,  $\{max\}$  is open and  $X$  has no minimum or  $\{min\}$  isn't open:  $A$  is topologically dense in  $X \setminus \{max\}$ , where  $max$  is the maximum in  $X$ .
- If  $X$  has a minimum,  $\{min\}$  is open and  $X$  has no maximum or  $\{max\}$  isn't open  $A$  is topologically dense in  $X \setminus \{min\}$ , where  $min$  is the minimum in  $X$ .
- If  $X$  has no minimum or maximum, or  $\{min, max\}$  has no proper open sets:  $A$  is topologically dense in  $X$ .

**lemma** `Wdense_ord_imp_dense_top`:

```

  assumes IsLinOrder(X,r) A{is weakly dense in}X{with respect to}r A⊆X
  ∃x y. x ≠ y ∧ x ∈ X ∧ y ∈ X
  HasAminimum(r,X)⟶{Minimum(r,X)}∈(OrdTopology X r)⟶Minimum(r,X)∈A
  HasAmaximum(r,X)⟶{Maximum(r,X)}∈(OrdTopology X r)⟶Maximum(r,X)∈A
  shows Closure(A,OrdTopology X r)=X

```

The conclusion is that an order topology is  $\kappa$ -separable iff there is a set  $A$  with cardinality strictly less than  $\kappa$  which is weakly-dense in  $X$ .

**theorem separable\_imp\_wdense:**

```

  assumes (OrdTopology X r){is separable of cardinal}Q  $\exists x y. x \neq y \wedge$ 
 $x \in X \wedge y \in X$ 

```

```

  IsLinOrder(X,r)

```

```

  shows  $\exists A \in \text{Pow}(X). A \prec Q \wedge (A \text{ is weakly dense in } X \text{ with respect to } r)$ 

```

**proof-**

```

  from assms obtain U where  $U \in \text{Pow}(\bigcup (\text{OrdTopology } X \text{ } r))$  Closure(U,OrdTopology
X r)= $\bigcup (\text{OrdTopology } X \text{ } r)$   $U \prec Q$ 

```

```

  unfolding IsSeparableOfCard_def by auto

```

```

  then have  $U \in \text{Pow}(X)$  Closure(U,OrdTopology X r)=X  $U \prec Q$  using union_ordtopology[OF

```

## 67 TopologicalGroup\_ZF.thy

```
theory TopologicalGroup_ZF imports Topology_ZF_3 Group_ZF_1 Semigroup_ZF
```

```
begin
```

This theory is about the first subject of algebraic topology: topological groups.

### 67.1 Topological group: definition and notation

Topological group is a group that is a topological space at the same time. This means that a topological group is a triple of sets, say  $(G, f, T)$  such that  $T$  is a topology on  $G$ ,  $f$  is a group operation on  $G$  and both  $f$  and the operation of taking inverse in  $G$  are continuous. Since IsarMathLib defines topology without using the carrier, (see `Topology_ZF`), in our setup we just use  $\bigcup T$  instead of  $G$  and say that the pair of sets  $(\bigcup T, f)$  is a group. This way our definition of being a topological group is a statement about two sets: the topology  $T$  and the group operation  $f$  on  $G = \bigcup T$ . Since the domain of the group operation is  $G \times G$ , the pair of topologies in which  $f$  is supposed to be continuous is  $T$  and the product topology on  $G \times G$  (which we will call  $\tau$  below).

This way we arrive at the following definition of a predicate that states that pair of sets is a topological group.

**definition**

```
IsAtopologicalGroup(T,f)  $\equiv$  (T {is a topology})  $\wedge$  IsAgroup( $\bigcup T$ ,f)  $\wedge$ 
IsContinuous(ProductTopology(T,T),T,f)  $\wedge$ 
IsContinuous(T,T,GroupInv( $\bigcup T$ ,f))
```

We will inherit notation from the `topology0` locale. That locale assumes that  $T$  is a topology. For convenience we will denote  $G = \bigcup T$  and  $\tau$  to be the product topology on  $G \times G$ . To that we add some notation specific to groups. We will use additive notation for the group operation, even though we don't assume that the group is abelian. The notation  $g + A$  will mean the left translation of the set  $A$  by element  $g$ , i.e.  $g + A = \{g + a \mid a \in A\}$ . The group operation  $G$  induces a natural operation on the subsets of  $G$  defined as  $\langle A, B \rangle \mapsto \{x + y \mid x \in A, y \in B\}$ . Such operation has been considered in `func_ZF` and called  $f$  "lifted to subsets of"  $G$ . We will denote the value of such operation on sets  $A, B$  as  $A + B$ . The set of neighborhoods of zero (denoted  $\mathcal{N}_0$ ) is the collection of (not necessarily open) sets whose interior contains the neutral element of the group.

```
locale topgroup = topology0 +
```

```
fixes G
```

```
defines G_def [simp]: G  $\equiv$   $\bigcup T$ 
```

```

fixes prodtop ( $\tau$ )
defines prodtop_def [simp]:  $\tau \equiv \text{ProductTopology}(T,T)$ 

fixes f

assumes Ggroup: IsAgroup(G,f)

assumes fcon: IsContinuous( $\tau,T,f$ )

assumes inv_cont: IsContinuous( $T,T,\text{GroupInv}(G,f)$ )

fixes grop (infixl + 90)
defines grop_def [simp]:  $x+y \equiv f\langle x,y \rangle$ 

fixes grinv (- _ 89)
defines grinv_def [simp]:  $(-x) \equiv \text{GroupInv}(G,f)(x)$ 

fixes grsub (infixl - 90)
defines grsub_def [simp]:  $x-y \equiv x+(-y)$ 

fixes setinv (- _ 72)
defines setninv_def [simp]:  $-A \equiv \text{GroupInv}(G,f)(A)$ 

fixes ltrans (infix + 73)
defines ltrans_def [simp]:  $x + A \equiv \text{LeftTranslation}(G,f,x)(A)$ 

fixes rtrans (infix + 73)
defines rtrans_def [simp]:  $A + x \equiv \text{RightTranslation}(G,f,x)(A)$ 

fixes setadd (infixl + 71)
defines setadd_def [simp]:  $A+B \equiv (f \text{ \{lifted to subsets of\} } G)\langle A,B \rangle$ 

fixes gzero (0)
defines gzero_def [simp]:  $0 \equiv \text{TheNeutralElement}(G,f)$ 

fixes zerohoods ( $\mathcal{N}_0$ )
defines zerohoods_def [simp]:  $\mathcal{N}_0 \equiv \{A \in \text{Pow}(G). 0 \in \text{int}(A)\}$ 

fixes listsum ( $\sum$  _ 70)
defines listsum_def[simp]:  $\sum k \equiv \text{Fold1}(f,k)$ 

```

The first lemma states that we indeed talk about topological group in the context of topgroup locale.

```

lemma (in topgroup) topGroup: shows IsAtopologicalGroup(T,f)
  using topSpaceAssum Ggroup fcon inv_cont IsAtopologicalGroup_def
  by simp

```

If a pair of sets  $(T, f)$  forms a topological group, then all theorems proven

in the `topgroup` context are valid as applied to  $(T, f)$ .

```
lemma topGroupLocale: assumes IsAtopologicalGroup(T,f)
  shows topgroup(T,f)
  using assms IsAtopologicalGroup_def topgroup_def
    topgroup_axioms.intro topology0_def by simp

## 67.2 Interval arithmetic, translations and inverse of set

In this section we list some properties of operations of translating a set and reflecting it around the neutral element of the group. Many of the results are proven in other theories, here we just collect them and rewrite in notation specific to the `topgroup` context.

Different ways of looking at adding sets.

```

lemma (in topgroup) interval_add: assumes A⊆G B⊆G shows
  A+B ⊆ G and A+B = f(A×B)  A+B = (⋃ x∈A. x+B)
proof -
  from assms show A+B ⊆ G and A+B = f(A×B)
    using topgroup_f_binop lift_subsets_explained by auto
  from assms show A+B = (⋃ x∈A. x+B)
    using group0_valid_in_tgroup group0.image_ltrans_union by simp
qed

```

Right and left translations are continuous.

```

lemma (in topgroup) trans_cont: assumes g∈G shows
  IsContinuous(T,T,RightTranslation(G,f,g)) and
  IsContinuous(T,T,LeftTranslation(G,f,g))
using assms group0_valid_in_tgroup group0.trans_eq_section
topgroup_f_binop fcon prod_top_spaces0_valid
prod_top_spaces0.fix_1st_var_cont prod_top_spaces0.fix_2nd_var_cont
by auto

```

Left and right translations of an open set are open.

```

lemma (in topgroup) open_tr_open: assumes g∈G and V∈T
  shows g+V ∈ T and V+g ∈ T
  using assms neg_in_tgroup trans_cont IsContinuous_def
  group0_valid_in_tgroup group0.trans_image_vimage by auto

```

Right and left translations are homeomorphisms.

```

lemma (in topgroup) tr_homeo: assumes g∈G shows
  IsAhomeomorphism(T,T,RightTranslation(G,f,g)) and
  IsAhomeomorphism(T,T,LeftTranslation(G,f,g))
using assms group0_valid_in_tgroup group0.trans_bij trans_cont open_tr_open
bij_cont_open_homeo by auto

```

Translations preserve interior.

```
lemma (in topgroup) trans_interior: assumes A1:  $g \in G$  and A2:  $A \subseteq G$ 
  shows  $g + \text{int}(A) = \text{int}(g+A)$ 
proof -
  from assms have  $A \subseteq \bigcup T$  and IsAhomeomorphism( $T, T, \text{LeftTranslation}(G, f, g)$ )
  using tr_homeo by auto
  then show thesis using int_top_invariant by simp
qed
```

Inverse of an open set is open.

```

## 67.5 Sums of sequences of elements and subsets

In this section we consider properties of the function  $G^n \rightarrow G, x = (x_0, x_1, \dots, x_{n-1}) \mapsto \sum_{i=0}^{n-1} x_i$ . We will model the cartesian product  $G^n$  by the space of sequences  $n \rightarrow G$ , where  $n = \{0, 1, \dots, n-1\}$  is a natural number. This space is equipped with a natural product topology defined in `Topology_ZF_3`.

Let's recall first that the sum of elements of a group is an element of the group.

```

lemma (in topgroup) sum_list_in_group:
  assumes n ∈ nat and x: succ(n)→G
  shows (∑ x) ∈ G
proof -
  from assms have semigr0(G,f) and n ∈ nat x: succ(n)→G
  using semigr0_valid_in_tgroup by auto
  then have Fold1(f,x) ∈ G by (rule semigr0.prod_type)
  thus (∑ x) ∈ G by simp
qed

```

In this context  $x+y$  is the same as the value of the group operation on the elements  $x$  and  $y$ . Normally we shouldn't need to state this as a separate lemma.

```

lemma (in topgroup) grop_def1: shows f⟨x,y⟩ = x+y by simp

```

Another theorem from `Semigroup_ZF` theory that is useful to have in the additive notation.

```

lemma (in topgroup) shorter_set_add:
  assumes n ∈ nat and x: succ(succ(n))→G
  shows (∑ x) = (∑ Init(x)) + (x(succ(n)))
proof -
  from assms have semigr0(G,f) and n ∈ nat x: succ(succ(n))→G
  using semigr0_valid_in_tgroup by auto
  then have Fold1(f,x) = f⟨Fold1(f,Init(x)),x(succ(n))⟩
  by (rule semigr0.shorter_seq)
  thus thesis by simp
qed

```

Sum is a continuous function in the product topology.

```

theorem (in topgroup) sum_continuous: assumes n ∈ nat
  shows IsContinuous(SeqProductTopology(succ(n),T),T,{⟨x,∑ x⟩.x∈succ(n)→G})
proof -
  note 'n ∈ nat'

### 68.1 Local properties.

This theory file deals with local topological properties; and applies local compactness to the one point compactification.

We will say that a topological space is locally @term"P" iff every point has a neighbourhood basis of subsets that have the property @term"P" as subspaces.

**definition**

```
IsLocally (_{is locally}_ 90)
  where T{is a topology}  $\implies$  T{is locally}P  $\equiv$   $(\forall x \in \bigcup T. \forall b \in T. x \in b \longrightarrow$ 
 $(\exists c \in \text{Pow}(b). x \in \text{Interior}(c, T) \wedge P(c, T)))$ 
```

#### 68.1.1 First examples

Our first examples deal with the locally finite property. Finiteness is a property of sets, and hence it is preserved by homeomorphisms; which are in particular bijective.

The discrete topology is locally finite.

**lemma** discrete\_locally\_finite:

```
  shows Pow(A){is locally}( $\lambda A. (\lambda B. \text{Finite}(A))$ )
```

**proof-**

```
  have  $\forall b \in \text{Pow}(A). \bigcup (\text{Pow}(A)\{\text{restricted to}\}b) = b$  unfolding RestrictedTo_def
by blast
```

```
  then have  $\forall b \in \{\{x\}. x \in A\}. \text{Finite}(b)$  by auto moreover
```

```
  have  $\text{reg} : \forall S \in \text{Pow}(A). \text{Interior}(S, \text{Pow}(A)) = S$  unfolding Interior_def by
auto
```

```
  {
    fix x b assume  $x \in \bigcup \text{Pow}(A)$   $b \in \text{Pow}(A)$   $x \in b$ 
    then have  $\{x\} \subseteq b$   $x \in \text{Interior}(\{x\}, \text{Pow}(A))$   $\text{Finite}(\{x\})$  using reg by
auto
```

```
    then have  $\exists c \in \text{Pow}(b). x \in \text{Interior}(c, \text{Pow}(A)) \wedge \text{Finite}(c)$  by blast
  }
```

```
  then have  $\forall x \in \bigcup \text{Pow}(A). \forall b \in \text{Pow}(A). x \in b \longrightarrow (\exists c \in \text{Pow}(b). x \in \text{Interior}(c, \text{Pow}(A))$ 
 $\wedge \text{Finite}(c))$  by auto
```

```

### 68.1.2 Local compactness

definition

```

IsLocallyComp (_{is locally-compact} 70)
where T{is locally-compact} $\equiv T\{is\ locally\}(\lambda B. \lambda T. B\{is\ compact\ in\}T)$ 

```

We center ourselves in local compactness, because it is a very important tool in topological groups and compactifications.

If a subset is compact of some cardinal for a topological space, it is compact of the same cardinal in the subspace topology.

lemma compact\_imp\_compact\_subspace:

```

    assumes A{is compact of cardinal}K{in}T  $A \subseteq B$ 
    shows A{is compact of cardinal}K{in}(T{restricted to}B) unfolding IsCompactOfCard_def

```

proof

### 68.1.3 Compactification by one point

Given a topological space, we can always add one point to the space and get a new compact topology; as we will check in this section.

**definition**

```

OPCompactification ({one-point compactification of}_ 90)
  where {one-point compactification of} $T \equiv T \cup \{\bigcup T\} \cup ((\bigcup T) - K)$ .  $K \in \{B \in \text{Pow}(\bigcup T). B \{\text{is compact in}\} T \wedge B \{\text{is closed in}\} T\}$ 

```

Firstly, we check that what we defined is indeed a topology.

**theorem** (in topology0) op\_comp\_is\_top:

```

then show  $T\{\text{is regular}\}$  using open\_subspace(2) by auto

qed

This last corollary has an explanation: In Hausdorff spaces, compact sets are closed and regular spaces are exactly the "locally closed spaces" (those which have a neighbourhood basis of closed sets). So the neighbourhood basis of compact sets also works as the neighbourhood basis of closed sets we needed to find.

#### 68.1.4 Hereditary properties and local properties

In this section, we prove a relation between a property and its local property for hereditary properties. Then we apply it to locally-Hausdorff or locally- $T_2$ . We also prove the relation between locally- $T_2$  and another property that appeared when considering anti-properties, the anti-hyperconnectness.

If a property is hereditary in open sets, then local properties are equivalent

to find just one open neighbourhood with that property instead of a whole local basis.

```

```

Now we find a counter-example for: Every anti-hyperconnected space is locally-Hausdorff.

The example we are going to consider is the following. Put in  $X$  an anti-hyperconnected topology, where an infinite number of points don't have finite sets as neighbourhoods. Then add a new point to the set,  $p \notin X$ . Consider the open sets on  $X \cup p$  as the anti-hyperconnected topology and the open sets that contain  $p$  are  $p \cup A$  where  $X \setminus A$  is finite.

This construction equals the one-point compactification iff  $X$  is anti-compact; i.e., the only compact sets are the finite ones. In general this topology is contained in the one-point compactification topology, making it compact too.

It is easy to check that any open set containing  $p$  meets infinite other non-empty open set. The question is if such a topology exists.

```

```

The previous construction, applied to a densely ordered topology, gives the desired counterexample. What happens is that every neighbourhood of  $\bigcup T$  is dense; because there are no finite open sets, and hence meets every non-empty open set. In conclusion,  $\bigcup T$  cannot be separated from other points by disjoint open sets.

Every open set that contains  $\bigcup T$  is dense, when considering the order topology in a densely ordered set with more than two points.

**theorem** neigh\_infPoint\_dense:

```

  fixes T X r
  defines T_def:  $T \equiv (\text{OrdTopology } X \ r)$ 
  assumes IsLinOrder(X,r) X{is dense with respect to}r
     $\exists x \ y. \ x \neq y \wedge x \in X \wedge y \in X \ U \in ((\{\text{one-point compactification of}\}(\text{CoFinite } (\bigcup T))) - \{\{\bigcup T\}\}) \cup T$ 
     $\bigcup T \in U$ 
     $V \in ((\{\text{one-point compactification of}\}(\text{CoFinite } (\bigcup T))) - \{\{\bigcup T\}\}) \cup T \ V \neq 0$ 
  shows  $U \cap V \neq 0$ 

```

## 69 TopologicalGroup\_ZF\_1.thy

**theory** TopologicalGroup\_ZF\_1 **imports** TopologicalGroup\_ZF Topology\_ZF\_properties\_2  
**begin**

This theory deals with some topological properties of topological groups.

### 69.1 Separation properties of topological groups

The topological groups have very specific properties. For instance,  $G$  is  $T_0$  iff it is  $T_3$ .

```

Every topological group is regular, and hence  $T_3$ . The proof is in the next section, since it uses local properties.

## 69.4 Local properties

In a topological group, all local properties depend only on the neighbourhoods of the neutral element; when considering topological properties. The next result of regularity, will use this idea, since translations preserve closed sets.

```

lemma (in topgroup) local_iff_neutral:
  assumes  $\forall U \in \mathcal{T} \cap \mathcal{N}_0. \exists N \in \mathcal{N}_0. N \subseteq U \wedge P(N, T) \forall N \in \text{Pow}(G). \forall x \in G. P(N, T) \longrightarrow P(x+N, T)$ 
  shows  $T\{\text{is locally}\}P$ 
proof-
  {
    fix x U assume  $x \in \bigcup T \vee U \in T \wedge x \in U$ 
    then have  $(-x)+U \in \mathcal{T} \cap \mathcal{N}_0$  using open_tr_open(1) open_trans_neigh neg_in_tgroup

Metamath's set.mm features a large (over 8000) collection of theorems proven in the ZFC set theory. This theory is part of an attempt to translate those theorems to Isar so that they are available for Isabelle/ZF users. A total of about 1200 assertions have been translated, 600 of that with proofs (the rest was proven automatically by Isabelle). The translation was done with the support of the mmisar tool, whose source is included in the IsarMathLib distributions prior to version 1.6.4. The translation tool was doing about 99 percent of work involved, with the rest mostly related to the difference between Isabelle/ZF and Metamath metalogics. Metamath uses Tarski-Megill metalogic that does not have a notion of bound variables (see [http://planetx.cc.vt.edu/AsteroidMeta/Distinctors\\_vs\\_binders](http://planetx.cc.vt.edu/AsteroidMeta/Distinctors_vs_binders) for details and discussion). The translation project is closed now as I decided that it was too boring and tedious even with the support of mmisar software. Also, the translated proofs are not as readable as native Isar proofs which goes against IsarMathLib philosophy.

### 72.1 Importing from Metamath - how is it done

We are interested in importing the theorems about complex numbers that start from the "recnt" theorem on. This is done mostly automatically by the mmisar tool that is included in the IsarMathLib distributions prior to version 1.6.4. The tool works as follows:

First it reads the list of (Metamath) names of theorems that are already imported to IsarMathlib ("known theorems") and the list of theorems that are intended to be imported in this session ("new theorems"). The new theorems are consecutive theorems about complex numbers as they appear in the Metamath database. Then mmisar creates a "Metamath script" that contains Metamath commands that open a log file and put the statements and proofs of the new theorems in that file in a readable format. The tool writes this script to a disk file and executes metamath with standard input redirected from that file. Then the log file is read and its contents converted to the Isar format. In Metamath, the proofs of theorems about complex numbers depend only on 28 axioms of complex numbers and some basic logic and set theory theorems. The tool finds which of these dependencies are not known yet and repeats the process of getting their statements from Metamath as with the new theorems. As a result of this process mmisar creates files new\_theorems.thy, new\_deps.thy and new\_known\_theorems.txt. The file new\_theorems.thy contains the theorems (with proofs) imported from Metamath in this session. These theorems are added (by hand) to the

current `MMI_Complex_ZF_x.thy` file. The file `new_deps.thy` contains the statements of new dependencies with generic proofs "by auto". These are added to the `MMI_logic_and_sets.thy`. Most of the dependencies can be proven automatically by Isabelle. However, some manual work has to be done for the dependencies that Isabelle can not prove by itself and to correct problems related to the fact that Metamath uses a metalogic based on distinct variable constraints (Tarski-Megill metalogic), rather than an explicit notion of free and bound variables.

The old list of known theorems is replaced by the new list and `mmisar` is ready to convert the next batch of new theorems. Of course this rarely works in practice without tweaking the `mmisar` source files every time a new batch is processed.

## 72.2 The context for Metamath theorems

We list the Metamath's axioms of complex numbers and define notation here.

The next definition is what Metamath  $X \in V$  is translated to. I am not sure why it works, probably because Isabelle does a type inference and the "=" sign indicates that both sides are sets.

### definition

```
IsASet :: i⇒o ( _ isASet [90] 90) where
```

```
IsASet_def[simp]: X isASet ≡ X = X
```

The next locale sets up the context to which Metamath theorems about complex numbers are imported. It assumes the axioms of complex numbers and defines the notation used for complex numbers.

One of the problems with importing theorems from Metamath is that Metamath allows direct infix notation for binary operations so that the notation  $a f b$  is allowed where  $f$  is a function (that is, a set of pairs). To my knowledge, Isar allows only notation  $f \langle a, b \rangle$  with a possibility of defining a syntax say  $a + b$  to mean the same as  $f \langle a, b \rangle$  (please correct me if I am wrong here). This is why we have two objects for addition: one called `caddset` that represents the binary function, and the second one called `ca` which defines the  $a + b$  notation for `caddset` $\langle a, b \rangle$ . The same applies to multiplication of real numbers.

Another difficulty is that Metamath allows to define sets with syntax  $\{x|p\}$  where  $p$  is some formula that (usually) depends on  $x$ . Isabelle allows the set comprehension like this only as a subset of another set i.e.  $\{x \in A.p(x)\}$ . This forces us to have a slightly different definition of (complex) natural numbers, requiring explicitly that natural numbers is a subset of reals. Because of that, the proofs of Metamath theorems that reference the definition directly can not be imported.

## 73 Metamath\_interface.thy

```
theory Metamath_interface imports Complex_ZF MMI_prelude
```

```
begin
```

This theory contains some lemmas that make it possible to use the theorems translated from Metamath in a the `complex0` context.

### 73.1 MMIsar0 and complex0 contexts.

In the section we show a lemma that the assumptions in `complex0` context imply the assumptions of the `MMIsar0` context. The `Metamath_sampler` theory provides examples how this lemma can be used.

The next lemma states that we can use the theorems proven in the `MMIsar0` context in the `complex0` context. Unfortunately we have to use low level Isabelle methods "rule" and "unfold" in the proof, simp and blast fail on the order axioms.

```

## 74 Metamath\_sampler.thy

```
theory Metamath_sampler imports Metamath_interface MMI_Complex_ZF_2
```

```
begin
```

The theorems translated from Metamath reside in the `MMI_Complex_ZF`, `MMI_Complex_ZF_1` and `MMI_Complex_ZF_2` theories. The proofs of these theorems are very verbose and for this reason the theories are not shown in the proof document or the FormaMath.org site. This theory file contains some examples of theorems translated from Metamath and formulated in the `complex0` context. This serves two purposes: to give an overview of the material covered in the translated theorems and to provide examples of how to take a translated theorem (proven in the `MMIsar0` context) and transfer it to the `complex0` context. The typical procedure for moving a theorem from `MMIsar0` to `complex0` is as follows: First we define certain aliases that map names defined in the `complex0` to their corresponding names in the `MMIsar0` context. This makes it easy to copy and paste the statement of the theorem as displayed with ProofGeneral. Then we run the Isabelle from ProofGeneral up to the theorem we want to move. When the theorem is verified ProofGeneral displays the statement in the raw set theory notation, stripped from any notation defined in the `MMIsar0` locale. This is what we copy to the proof in the `complex0` locale. After that we just can write "then have ?thesis by simp" and the simplifier translates the raw set theory notation to the one used in `complex0`.

### 74.1 Extended reals and order

In this section we import a couple of theorems about the extended real line and the linear order on it.

Metamath uses the set of real numbers extended with  $+\infty$  and  $-\infty$ . The  $+\infty$  and  $-\infty$  symbols are defined quite arbitrarily as  $\mathbb{C}$  and  $\{\mathbb{C}\}$ , respectively. The next lemma that corresponds to Metamath's `renfdisj` states that  $+\infty$  and  $-\infty$  are not elements of  $\mathbb{R}$ .

```
lemma (in complex0) renfdisj: shows  $\mathbb{R} \cap \{+\infty, -\infty\} = \emptyset$ 
proof -
  let real =  $\mathbb{R}$ 
  let complex =  $\mathbb{C}$ 
  let one = 1
  let zero = 0
  let iunit = i
  let caddset = CplxAdd(R,A)
  let cmulset = CplxMul(R,A,M)
  let lessrrel = StrictVersion(CplxROrder(R,A,r))
  have MMIsar0
```

```

    (real, complex, one, zero, iunit, caddset, cmulset, lessrrel)
    using MMIsar_valid by simp
  then have real  $\cap$  {complex, {complex}} = 0
    by (rule MMIsar0.MMI_renfdisj)
  thus  $\mathbb{R} \cap \{+\infty, -\infty\} = 0$  by simp
qed

```

The order relation used most often in Metamath is defined on the set of complex reals extended with  $+\infty$  and  $-\infty$ . The next lemma allows to use Metamath's `xrltso` that states that the  $<$  relations is a strict linear order on the extended set.

```

lemma (in complex0) xrltso: shows < Orders  $\mathbb{R}^*$ 
proof -
  let real =  $\mathbb{R}$ 
  let complex =  $\mathbb{C}$ 
  let one = 1
  let zero = 0
  let iunit = i
  let caddset = CplxAdd(R,A)
  let cmulset = CplxMul(R,A,M)
  let lessrrel = StrictVersion(CplxROrder(R,A,r))
  have MMIsar0
    (real, complex, one, zero, iunit, caddset, cmulset, lessrrel)
    using MMIsar_valid by simp
  then have
    (lessrrel  $\cap$  real  $\times$  real  $\cup$

## 74.2 Natural real numbers

In standard mathematics natural numbers are treated as a subset of real numbers. From the set theory point of view however those are quite different objects. In this section we talk about "real natural" numbers i.e. the counterpart of natural numbers that is a subset of the reals.

Two ways of saying that there are no natural numbers between  $n$  and  $n + 1$ .

**lemma** (in complex0) no\_nats\_between:

assumes A1:  $n \in \mathbb{N}$   $k \in \mathbb{N}$

shows

$n \leq k \longleftrightarrow n < k + 1$

$n < k \longleftrightarrow n + 1 \leq k$

**proof** -

let real =  $\mathbb{R}$

let complex =  $\mathbb{C}$

let one = 1

let zero = 0

let iunit = i

let caddset = CplxAdd(R,A)

let cmulset = CplxMul(R,A,M)

let lessrrel = StrictVersion(CplxROrder(R,A,r))

have I: MMIIsar0

(real, complex, one, zero, iunit, caddset, cmulset, lessrrel)

using MMIIsar\_valid by simp

then have

$n \in \bigcap \{N \in \text{Pow}(\text{real}) . \text{one} \in N \wedge$

$(\forall n. n \in N \longrightarrow \text{caddset } \langle n, \text{one} \rangle \in N)\}$   $\wedge$

$k \in \bigcap \{N \in \text{Pow}(\text{real}) . \text{one} \in N \wedge$

$(\forall n. n \in N \longrightarrow \text{caddset } \langle n, \text{one} \rangle \in N)\} \longrightarrow$

$\langle k, n \rangle \notin$

$\text{lessrrel} \cap \text{real} \times \text{real} \cup \{\langle \{\text{complex}\}, \text{complex} \rangle\} \cup \text{real} \times \{\text{complex}\}$

∪

$\{\{\text{complex}\}\} \times \text{real} \longleftrightarrow$

$\langle n, \text{caddset } \langle k, \text{one} \rangle \rangle \in$

$\text{lessrrel} \cap \text{real} \times \text{real} \cup \{\langle \{\text{complex}\}, \text{complex} \rangle\} \cup \text{real} \times \{\text{complex}\}$

∪

$\{\{\text{complex}\}\} \times \text{real}$  by (rule MMIIsar0.MMI\_nnleltp1t)

then have  $n \in \mathbb{N} \wedge k \in \mathbb{N} \longrightarrow n \leq k \longleftrightarrow n < k + 1$

by simp

with A1 show  $n \leq k \longleftrightarrow n < k + 1$  by simp

from I have

```

n ∈ ⋂{N ∈ Pow(real) . one ∈ N ∧
(∀n. n ∈ N → caddset ⟨n, one⟩ ∈ N)} ∧
k ∈ ⋂{N ∈ Pow(real) . one ∈ N ∧
(∀n. n ∈ N → caddset ⟨n, one⟩ ∈ N)} →
⟨n, k⟩ ∈
lessrrel ∩ real × real ∪
{⟨{complex}, complex⟩} ∪ real × {complex} ∪
{{complex}} × real ↔ ⟨k, caddset ⟨n, one⟩⟩ ∉
lessrrel ∩ real × real ∪ {⟨{complex}, complex⟩} ∪ real × {complex}
∪

```

lemma (in complex0) infmsup:
  assumes A  $\subseteq \mathbb{R}$  and A  $\neq \emptyset$  and  $\exists x \in \mathbb{R}. \forall y \in A. x \leq y$ 
  shows
    Infim(A,  $\mathbb{R}$ , <)  $\in \mathbb{R}$ 
    Infim(A,  $\mathbb{R}$ , <) = ( -Sup( $\{z \in \mathbb{R}. (-z) \in A\}$ ,  $\mathbb{R}$ , <) )
proof -

```
